> I notice that Peet and Davis

The APRS sig has a head to head look and came out about the same
for the home user. BUT one big APRS difference.

If you want to put one in a remote location with out a
control computer ,that is use a radio and TNC to send WX data
then the Peet unit is only one that now can to that.

The TNC can do the work of when to send the data in its buffer
but the WX data needs to flow into the TNC first.

I also am looking to get a unit soon and would get the Davis
but I also need a second unit at a remote location.

Both units are supported by APRS and work well with a
DOS/WIN/MAC APRS computer system.

1504. Packet <==> SMTP Internet Gateway

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-06 00:00:00 UTC
From: Mike Cat <NotValid@email.address>
Message-ID: <331EE0A2.2E91@email.address>
Source record: 31204

I know this is a question that has been asked many times in the past, so forgive me for asking.

I have a friend who will be sailing for the summer who will be on packet and he wants to have a means for sending and receiving email via packet to the internet and vice versa. The traffic from the internet to him will be from non amateurs.

I am willing to act as the "mediator" providing a manual 'bridge' between packet and SMTP, but I was wondering if there are any [private] gateways that can be used by him directly.

We realize the issue of having 3rd party email traffic entering into the packet system. Perhaps this is why there are no public gateways that are generally known.

Any input and insight would be of great help.

Thanks and 73!

Hello, OM.

The `Funet' has one of the most famous hamradio archive from the beginning of the Internet. From last year, a mirror of Funet archive is established in Ring project, Japan. This mirror distributes only Funet original area, but ucsd.edu is nearer than Funet from Japan, and Asian countries. :-)

Try the following URL:
<ftp://ring.aist.go.jp/pub/misc/ham/>
<ftp://ring.crl.go.jp/archives/misc/ham/>
<ftp://ring.etl.go.jp/pub/misc/ham/>
General information of the servers is available from:

The head-to-head comparison was also very obviously written by someone at Davis. (In additions to some inaccuracies concerning the Peet units, the word "we" was used in reference to Davis.)

Unfortunately, most of us own only one brand or the other and most of us will rationalize our purchase, so finding someone to give a true, fair comparison is tough. It probably depends more on exactly what you want to do. For instance, if you are most interested in having temp and wind speed for APRS, it will be hard to beat the value of the U-500. It gets more complicated as your needs increase.

1514. New ! New ! Version 97 ! of MAKE MONEY FAST

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-08 00:00:00 UTC
From: belive_it@r-not.com
Message-ID: <331b8be5.9467257@NNTP.NETCRUISER>
Source record: 31118

YOU CAN MAKE $50,000 IN LESS THAN 90 DAYS IN THE COMFORT OF YOUR OWN HOME!

**** DO NOT BE QUICK TO DISMISS THIS !!! IT WILL MAKE YOU A LOT OF MONEY ****

...Read the enclosed program... then read it again!

Dear Friend,
You are now reading the most profitable and unique program you may ever see. It has demonstrated and proven ability to generate large sums of money. This program is showing fantastic appeal with a huge and ever growing population which needs additional income. IT WILL WORK FOR YOU, (don't let this slip through your fingers like I almost did) if you CAREFULLY FOLLOW the instructions and apply these next four points:

(1) INSIGHT: It is necessary to see the GREAT possibilities that this marketing program contains. READ IT SEVERAL TIMES, then later read it again! Calculate the numbers for yourself; you will see the amazing results that can be obtained.

(2) INVESTMENT: Not in me, or anyone else, but in yourself. Every endeavor which produces a profit requires some degree of investment, be it time, money, resources, etc. For the potential gain that can come to you, this investment is quite insignificant.

(3) APPLICATION: There is no such thing as a "FREE LUNCH". Even this opportunity requires some effort and time. Every successful venture does.

(4) PATIENCE: After you have accomplished the steps described, the program requires a little time before showing a good response. As it enters the 1st, 2nd, 3rd, and finally the 4th level of response, there is a time element that to some could be a bit aggravating without giving proper thought to *how* the program works, AND IT DOES WORK! You must allow 20 to 90 days... so be patient! "ALL THINGS COME TO THOSE WHO WAIT!"

This is a LEGITIMATE, LEGAL, money-making opportunity. It does not require you to come in contact with people, do any hard work, and best of all, you never have to leave the house, except to get the mail. If you believe that someday you will get that lucky break that you have been waiting for, THIS IS IT! Simply follow the easy instructions, and your dream will come true! This multi-level mail order marketing program works perfectly... 100% EVERY TIME.

Thousands of people have used this program to raise capital to start their own business, pay off debts, buy homes, cars, etc., even retire! This is your chance, so don't pass it up... I cannot stress this enough! FOLLOW THE INSTRUCTIONS EXACTLY, and in 20 to 90 days you could receive upwards of $50,000. Let's face it, the profits are worth it! THEY'RE

TREMENDOUS!!! So go for it. Remember the 4 points and we'll see you at the top!

I N S T R U C T I O N S
==========

Follow these easy steps to achieve maximum results:

In the MULTI-LEVEL MAIL ORDER MARKETING BUSINESS, we have a method of raising capital that works 100% every time! I am sure that you could use $50,000 to $125,000 in the next 20 to 90 days. Before you say "NO WAY", PLEASE STUDY THS PROGRAM CAREFULLY.

THIS IS *NOT* A CHAIN LETTER, but a legal, money-making opportunity. Basically, this is what we do: As with all multi-level businesses, we build our business by recruiting new partners and selling our products. We do this through regular mail or through the information superhighway - the Internet. You are not involved in personal selling. You do it privately in your own home, store or office! Each $5.00 order you will receive will have a self-addressed stamped envelope in it! To fill each order, you simply put the product (a financial report) in the envelope and mail it back. "That's it... the $5.00 is yours." This is the GREATEST multi-level mail order marketing anywhere!

(1) ORDER ALL 4 REPORTS LISTED AND NUMBERED BELOW IN THIS LETTER. Do this by ordering the report from each of the four names listed. For each report send US$5.00 cash and a SELF-ADDRESSED STAMPED ENVELOPE (business size #10) to the person listed and REQUEST THAT SPECIFIC REPORT. You will need all 4 reports because you will be reprinting and reselling them. PLEASE do not alter the names or their sequence other than instructed in this letter. IMPORTANT: Always provide same day service on all orders you receive!

(2) In this letter, replace the name and address under REPORT #1 with your own, moving the one that was there down to REPORT #2. Move the name and address under REPORT #2 to REPORT #3. Move the name and address listed under REPORT #3 to REPORT #4. The name and address that was under REPORT #4 is dropped off the list and is no doubt on the way to the bank. When doing this please make certain you copy everyone's name and address accurately. *Don't move the Report/Product positions*.

(3) Re-distribute this whole information packet (with, of course yourself at REPORT #1 position and everyone else bumped down one notch). You can do this in one of two ways:
(a) Internet : Just like I've done here, it's quick and it's virtually free... send this letter out via e-mail to every e-mail address you know or can get your hands on. There are many companies out there who sell huge e-mail address lists at very low prices. This is a great place to start! In this way you can send this letter out to virtually hundreds of thousands rather than just a few thousand as with snail mail. This will greatly multiply your profits. You can also post this letter on the internet newsgroups, the more the better for you... millions of people world-wide scan these

newsgroups... take advantage of that fact.
(b) Old Fashioned Snail Mail : Take this information packet to your "quick print" shop and have as many copies of each made as you can initially afford to print. You can always print more later. (The more copies, the bigger the discount). Send a copy of this entire package (it is all important) to everyone whose name and address you can get your hands on.
Start with friends and relatives since you can speak to them and encourage them to take advantage of this marvelous money making plan. Then as your time and finances allow, mail to anyone and everyone. You can get names and addresses from classified ads, phone books and other directories. You can also mail to small businesses whose addresses are available from their ads in the Yellow Pages and other publications. BEST OF ALL, purchase a "HOT NAME" mailing list from any of the list of brokers whose business it is to provide all sorts of mailing lists. You'll find that a good name list will make you more money than you could ever imagine... it's a great investment!

(4) Orders will soon start arriving in your mailbox for each of the 4 reports. At first, just for REPORT #1, then later for #2, #3, and #4... each of these orders will contain a US$5 bill and a self-addressed stamped envelope for you to use to mail back the requested report. It's easy!

HERE'S HOW THIS AMAZING PLAN WILL MAKE YOU $ MONEY $:

Let's say you decide to start small just to see how it goes and we'll assume you and all those involved only sent out 200 packets each (either via e-mail or via regular mail). Let's also assume that each mailing only receives a 5% response (keep in mind that many people will send out thousands of packets instead of only 200, but for the sake of example here we'll stick with 200). With a 5% return that's 10 people who participate by sending 200 each or 2,000 total. The 5% response to that brings 100 orders. Those 100 mail out 200 each or 20,000 total. The 5% return on 20,000 is 1,000. The 1,000 send out 200,000 total and that 5% response will generate 10,000 five dollar bills for you... CASH! Your total income in this example situation:

1st Level - 10 people respond out of 200 with $5 $50
2nd Level - 10 people respond to those 10 ($5 x 100) $500
3rd Level - 10 respond to the 100 ($5 x 1000) $5000
4th Level - 10 respond to those 1000 (10000 $5 bills) $50000
======
This totals to $55000

Remember friends, this is assuming that 95 out of every 100 people you mail to, do absolutely nothing with this opportunity and trash it. Dare to think for a moment what would happen if everyone sent out 1,000 packets instead of 200 (very easy to accomplish that via e-mail). Believe me, many people will do just that... and more. It is to their benefit to do so! Not a bad return for such a paltry investment of time and money.

T I P S F O R S U C C E S S
==========

Treat this as your business. Send for the 4 reports IMMEDIATELY so you will have them when the orders start coming in because: When you receive a $5 order, you *must* send out the requested report to comply with the US Postal & Lottery Laws, Title 18, Sections 1302 and 1341 or Title 39 Section 3005 in the US Code, also Code of Federal Regs. vol. 16, Sections 255 & 436 - which state that "a product or service must be exchanged for money received".

WHILE YOU WAIT FOR YOUR REPORTS TO ARRIVE:

(1) Name your new company (or use your own name if you wish).
(2) Re-arrange the names and addresses, including yours, and affix them under the correct report according to the directions, bumping off the 4th name (If you will be advertising by snail mail, you might want to re-type that whole page where the names and addresses appear, and of course include yours at REPORT #1).
(3) Obtain as many e-mail addresses or regular snail mail addresses as you can. If sending via snail mail, REPORT #3 (.. when you receive it in the mail) will tell you where you can get great snail mailing lists.
(4) If sending by snail mail, make enough copies of this letter to fill your mailing quantity.
(5) Copy the 4 reports when you do get them so you are able to send them out right away when you receive an order.

The check point that guarantees your success is simply this: You MUST receive 15 to 20 orders for REPORT #1! THIS IS A MUST! If you don't within 2 weeks, send out more packets until you do. Then, a couple of weeks later you should receive at least 100 orders for REPORT #2. If you don't, send out more packets until you do. Once you have received 100 or more orders for REPORT #2, YOU CAN RELAX, because YOU ARE ON YOUR WAY TO $50,000!. Also, remember, every time your name is moved down on the list you are in front of a different report, so you can keep track of your progress by what report people are ordering from you. "IT'S THAT EASY".

Now, here is the list of the 4 reports and whom to order them from:

(NOTE: Always send a Self-Addressed, Stamped Envelope with US$5 cash - concealed, of course - in your order for each report. Order each report by name and number).

* REPORT #1: "HOW TO MAKE $250,000 THROUGH MULTI-LEVEL SALES"

. This report will give you the much needed information to help you in this program. It will show you how you can make a quarter of a million dollars□ in just 3 months. $5 cash.

Order This report from : Golden West Limited
P.O. Box 176, 2496. E. Hastings Street
Vancouver, B.C. Canada, B3K 5T9

* REPORT #2: "MAJOR CORPORATIONS AND MULTI-LEVEL SALES"

. Learn the money making secrets of some of the well-known corporate giants. $5 cash.

Order This report from : K. Lundgren Enterprises
P.O. Box 31030, Gladstone RPO
Halifax, Nova Scotia, Canada, B3K 5T9

* REPORT #3: "SOURCES FOR THE BEST MAILING LIST"

.You have learned the importance of good mailing lists. Here is where you can send for them. $5 cash.

Order this report from : MYGIA Enterprise□
P.O. Box 424
Mifflinville, PA, USA 18631-0424

* REPORT #4: "EVALUATING MULTI-LEVEL SALES PROGRAMS"

. Find out which plans work, which ones don't... and why! $5 cash.

Order this report from : Home Business Unlimited
1954 Norfolk Dr.
Lodi, CA, USA 95242

.. I wish you good fortune and prosperity!

Cheers!
K. Lundgren

A NOTE FROM THE ORIGINATOR OF THIS PLAN
==========

By the time you have read the enclosed information and looked over the plan and the reports you should have concluded that such a plan, and one that is legal, could not have been created by an amateur.

Let me tell you a little about myself. I began as an independent small businessman in 1969. Using good business practices I had a profitable business for 10 years. In 1979 my business began falling off. I was doing the same things that were previously successful for me but now they just weren't working.

Finally it hit me. It wasn't me. It's just that our economy had gone crazy. Inflation and recession had replaced the stable economic growth that had been with us since 1945. I don't have to tell you what happened to the employment rate because many of you know from first hand experience. There were more small business failures and bankruptcies than ever before... Traditional methods of making money will never allow you to move up or "get rich". Inflation will see to that.

You have just received the information that can give you financial freedom for the rest of your life. With practically no risk and just a little bit of

effort, you can have more money in the next few months than you have ever imagined.

I should also point out that I will not see a penny of your money or anyone else's who participates in my plan. *This one's for you*.

I've made over FOUR MILLION DOLLARS and retired from the plan after having sent out over 16,000 letter packets. I have moved to the rich side of the tracks. Will you be able to say the same in six weeks ? If you send out☐ only one-tenth as many packets as I did, you can be a rich person.

Please follow the plan exactly as instructed. Do not change it in any way. It works exceedingly well as it is now. Remember to send a copy of all this introductory literature to everyone that you can think of. Don't feel hesitant about sending out only a few dozen packets in the beginning. One of the people that you send this packet to may send out 5,000 and your name will be on every single one of them. Remember though: the more you send out, the more potential customers you will reach. So my friend, I've given you the ideas, information, materials and opportunity to become financially independent. IT'S NOW UP TO YOU.

I am enjoying an early secure retirement on the fortune that I made by sending out packets just like this one. You too will be making easy money in three or four weeks... if you follow the simple steps outlined in this mailing. To be financially independent is to be free; free to make money decisions as you never have before, go into business, get into investments, retire, or take a vacation. No longer will the lack of money hold you back...

Will you ignore this amazing opportunity... or will you take advantage of it and change the direction of your life ? If you don't think this is a truly spectacular opportunity, then please take the time to re-read this material. You have indeed missed something. If you have any questions, please feel free to write the sender of this information. You'll get a prompt and informative reply.

My method is simple. I sell thousands of people a product for $5.00 that costs me pennies to produce and mail. Everyone involved in the program makes money for everyone else in the program. IF ANYONE MAKES MONEY, EVERYONE MAKES MONEY. I should also point out that this program is completely legal. At times, you've probably received chain letters asking you to send money but getting nothing in return - no product whatsoever. Not only are chain letters illegal, but the risk of someone breaking the chain makes them quite unattractive.

This plan has the effect and appeal of a chain letter, but is is legal since you are offering a legitimate product to your people. After they purchase the product from you, they produce more and resell the product. It's simple free enterprise at work, THE AMERICAN WAY.

As you have learned from the enclosed material, the "PRODUCT" in this plan is a series of four financial and business reports. The information contained in these reports will not only help you in making your

participation in this plan more rewarding, but will be useful to you in other business decisions you make in the years ahead. You are also buying the rights to reprint all of the reports which will be ordered from you by those to whom you choose to mail this packet.

The concise one and two page reports you'll be buying can easily be reproduced at a local copy center at a cost of approximately 4 cents per page in small quantities of 200. The price goes down considerably for larger quatities of 1,000 or more. Of course you may want to print just a small quantity until the money comes rolling in. You can always call your printer with another order.

. Good luck with this plan and GOD BLESS YOU,

Edward L. Green

1515. aor 3000a scanner software (looking)

Newsgroup: rec.radio.amateur.digital.misc

Announcing NEW
Ham Radio.FAQ

This is the second generation of the original file that was
a regular USENET posting entitled

"rec.radio.amateur.misc Frequently Asked Questions"

The NEW Ham Radio.FAQ is a HyperText document that is on the
WWW and it contains 3 chapters plus hundreds of LINKS to radio
related sites!

1 - Introduction to the Ham Radio.FAQ
2 - Amateur Radio Organizations, Services, and Data Sources
3 - Amateur Radio Advanced and Technical Questions

Please provide a copy of the Ham Radio.FAQ to any new or
soon-to-be Hams that you know or share with them the URL to this
site:

http://www.mv.com/ipusers/wd1v

Send me an EMAIL <or packet with your Email address> if you want the
FAQ text file sent to you as an attached <120 K> file with the words
"HAM FAQ" on the subject line.

Send me a formatted disk with SASE disk mailer if you want the
FAQ text file sent to you on disk. PC or Mac are fine.

==========
NEW RemoteGateway.Packet/Tor, FREE SOFTWARE OFFER !!
INFO pr Feb, 18th 1997:

SYNAPSE 0.43 is a multimode/crossband VHF/HF gateway and remote radio rig
control program just ready to be released these days.

The program is made by LA7XQ Steinar Wenaas, and it's FREEWARE.

SYNAPSE provides you REMOTE operating a KAM TNC, a HF (or VHF) radio on a
fixed or variable HF frequency from any VHF/UHF AX25 site based TNCs attached
to any PC or even a dumb terminal. You're then acting as a SYNAPSE CLIENT
and the remote KAM is your HOST.

The VHF (or UHF) user will be offered typical HF digital ARQ modes like
AMTOR, PACTOR and GTOR even he's miles away VHF FM client only!!

This version lets you remote control frequencies/modes/SWR/S-meter etc. on
KENWOOD HF radios from VHF. You may also remote control other gears like HOST
antenna relays, burglar alarms, power switches, modems etc. all from
the VHF client site or through telephone lines (remember in the latter case
you're not a radio ham forwarding hot spot nodes any more).

SYNAPSE also lets you miles away listening ongoing QSOs in AMTOR/PACTOR
or GTOR (the latter mode requires a KAM 8.0 or KAM+ to the PC interconnect).

You may also stay connected STANDBY in TOR mode ready to be LINKED to from
other HF stations and at the same time be able to watch FEC CQ calls.

SYNAPSE offers the possibility REMOTE receiving and forwarding BROADCAST modes like RTTY, ASCII, FEC (AMTOR = GTOR = TOR type) or the special PACTOR type FEC which runs 8 bits operation. This modes converts to the AX25 VHF streams as well.

Extra service - Callbacks:

Operating the KAM through SYNAPSE is done very much the same way as running HF modes locally on KAM in terminal mode, hence prefixed commands are given and you may run SYNAPSE help or control commands in parallel with your -TOR mode QSO operation. These commands have local callbacks reporting TNC status etc. back to the VHF/UHF client while operating.
Your commands are then prefixed and they are attached to a dispatch list while you're operate.

Many more commands are at your service, among some of many ON/OFF here:
* Automatic return into TOR after ending a QSO in any ARQ mode.
* Automatic seizing the link whenever you type. If OFF you may use type-ahead.
* Automatic flags showing link direction. ON or OFF at your choice.

Other options:
* Automatic generation of AMTOR SELCAL from a given amateur callsign.
* Automatic sending of correct CQ calls on HF for you (by a simple command).
* Link hand over with automatic call sign exchange.
* Link close down with automatic call sign, time and date.

At any time during a QSO you can ask "help" commands or information about bytes still to go, link quality, direction, speed, or change your atomization level of the program.

When no VHF/UHF user is connected, the KAM ARQBBS (HF mailbox) is set ON. HF callsigns are then switched back to default (defined by Host owner in a configuration file) and KAM is set into TOR STANDBY mode again.

REMOTE operation does not mean from a PC close to the HF radio only. It means remote operation miles away from the HF radio QTH by using the AX25 packet radio protocol on VHF or UHF.

SYNAPSE is then very suitable for EMERGENCY communications providing the rescue headquarter the full possibility to operate long distance HF PACTOR protocol from a site where no HF power or antennas are reachable.

Minimum hardware at the HF radio QTH are:
* Any HF rig. SSB radio mode using AFSK or RTTY mode using FSK.
* Any DOS PC with 1 RS 232 COM port. Recommended CPU 386 DX and upwards.
* Slower PCs may work in pure PACTOR QSOs.
* KAME or KAM+ version 7.1 and upwards.
* Any VHF/UHF FM rig.

Minimum hardware at the VHF/UHF radio QTH are:
* Any VHF/UHF radio to be operated by an AX25 packet TNC.
* Any AX25 packet TNC, even BAYCOM 'TNCs'.
* Any terminal, or PC with any communication program to operate the AX25 packet TNC.

As mention this version 0.43 of SYNAPSE offers the possibility to completely remote control KENWOOD radios on COM port 2, change frequency etc. etc..
This requires that the PC at the SYNAPSE/HF-QTH has an extra EIA RS232C COM port. Even other equipment may be controlled, ex. by COM port 3 and 4, as power supply switching HF radio, burglar alarm/warnings or antenna relays.

(LA7XQ have also made a burglar system (for club stations or home) that automatically produces a message in the HOST mailbox itself when the intruder comes. As a remote client you may then check if any intruders has innovated your premises at the club station.
A corresponding client program at home may periodically also checks that mailbox if you want even more automation.
Is this something for you too?)

A coming version of SYNAPSE will incorporate full ICOM radio rig protocol as well because LA7XQ has an ICOM-706 himself so this transceiver will be paid special attention to next time.

Other gears like YAESU rigs may come later if hams out there are interested.

SYNAPSE lets a HF station either link to the ARQBBS with Host owner call sign when no remote packet station is connected, or link to the already connected packet station staying standby in TOR.

Later versions of SYNAPSE may also incorporate possibility for a HF PACTOR or GTOR station to link to SYNAPSE from the HF side and in addition connect further on to the local VHF/UHF packet network.
We are working with that now.

SYNAPSE 0.43 FREEWARE is available on the following URL address:
http://home.sol.no/stwe

Comments and suggestions is highly appreciated.

Source record: 31126

Many of you may be familiar with APRS especially since the
recent articles in QST and other publications. This software
is available for DOS, MAC, and Win 3.1/95.

The way it works is that you mostly monitor for packets which
contain position (location) or WX information, but occasionally
you transmit packets of your own containing information about
your own station. When you do, the information pops up on the
screen/map of all the other monitoring stations. Some stations
connect GPS units to show position changes in motion...

What does this have to do with QRP? Well, first of all the power
and antenna gain are ALREADY a part of the beacon information...
Second, folks are interested in portable/mobile configurations that
can be devoted to APRS operation: palm-/lap-top computer, HF packet
TNC, radio (and possibly GPS).

So far, I have used my FT-990DC/PK-232/half-sloper at 5w and have shown
up on maps around the US. Watch for my "QRP APRS" operation on 30m
(10.151
lsb).

73, Brian ke7gh@qsl.net

The Woodside Literary Agency using a phony name wrote:

> We* are now accepting new & previously published writers for
> publication. We have 3 offices/ 2 in New York City/
>[...]

Hello, Friends,

1. The spammer/scammer Woodside "Literary Agency" spammed your newsgroup
today. They have spammed more than a thousand times this month. If you
didn't see this particular post, praise the cancelbots for doing their
job and canceling them. The Woodside "Agency" (in reality, a middle-aged
couple living in Queens named Ursula Sprachtman and James Leonard)
specializes in victimizing the ignorance of people who want to be
writers, but don't know the business.

2. This is what happens if you send them your writing, from a post on
alt.folklore.ghost-stories:
>I responded, perhaps foolishly, to the ad below. I sent a manuscript,
>with $150.00. Woodside since sent mail requesting an additional
>$250.00....Suspicious?
> p
>P.S. Too bad. My story is actually quite good.

3. Here is how to find out more:
http://www.geocities.com/~hitchcockc/main.html
or read my article from the Boston Phoenix:
http://www.bostonphoenix.com/archive/styles/97/02/13/NET_STALKING.html

4. Here is what happens when one writes an expos of a shady but
ruthless literary agency: Two FBI agents came to my door last week,
saying that Ursula Sprachman had filed a complaint with the US Attorney
General's Office, claiming that I had called her, identified myself by
name (!), and told her that I'd hired a hitman to come and slit her
throat (!!!). They were really quite friendly once we got it
straightened out, but really!

6. DO NOT SEND THEM OR ANY OTHER "LITERARY AGENCY" MONEY (see #7 below).
No matter what their name, how sincere they sound, and how much they
```

praise your work, no legitimate agent or publisher asks you for money upfront.

Jack Mingo
misc.writing's
ambassador of goodwill

PS Cancelbot owners, feel free to cancel this after you're sure that Woodside spam is safely gone.

>me a
>source code (of course, if you have it).
[snip]

I'm not sure that I really understand your question - KISS is a mode
of TNC operation that essentially removes all of the AX25 functions
from the TNC and reduces it to a box that translates an 8-bit asynch
stream on the "computer" side to HDLC frames on the "radio" side, and
vice versa. No driver is needed for this - you could use a simple
terminal program like Procomm to send KISS frames back and forth
to the TNC. The hard part would be writing the program (or Procomm
script language file) that would do the AX25 protocol stuff.

At any rate, you can find a complete description of the KISS protocol
in a file which is a collection of NOS info, called KA9QBGN.ZIP. It
is about 190 kilobytes long. One of the files it contains is called
KISS.TXT by K3MC and KA9Q which is a full description of KISS by the
"inventors", about 25 kilobytes. The KA9QBGN file should be at TAPR,
somewhere, although I don't have a directory for it. A few months
ago it was at HAM-server URL http://www.ati.com/hamserv in Directory:
/hamradio/packet/tcpip/docs/. It is also at all Simtel sites in the
simtelnet/msdos/tcpip/ directory. I can send you the KISS.TXT file
via Email if you like.

If you're looking for information on the AX25 protocol, the definitive
source is _AX25 AMATEUR PACKET-RADIO LINK-LAYER PROTOCOL_ which is
published by ARRL, for a few dollars. I believe it is also available
from them via ftp and/or Email server.

There is an example of Pascal source code that can decode AX25 frame
"header" fields in the BPQCODE package in a file called TERM4.PAS.

I hope that some of this, at least, gets you pointed in the right
direction. If you can be more specific about what you want to do,
send me a note and maybe I can help. Good luck - 73

Get a reasonable return of $20,000 to $50,000 by sending only $5. All you skeptics out there, TRY IT. You'll never know it doesn't work unless you do. Its only $5! This worst that could happen is losing that. The best that could happen is getting $50,000!!!

I hate these posts as much as you do. Please just give me a few minutes of your time. It will be worth it, I assure you. For only $5 how can you go wrong? THIS REALLY DOES WORK!!!!
It only cost me the postage and $5. READ ON!
Hello! I've got some awesome news that I think you need to take two minutes to read if you have ever thought "How could I make some serious cash in a hurry???," or been in serious debt, ready to do almost anything to get the money needed to pay off those bill collectors. So grab a snack, a warm cup of coffee, or a glass of your favorite beverage, get comfortable, and listen to this interesting, exciting find!
Let me start by saying that I FINALLY FOUND IT! That's right! I found it! And I HATE GET RICH QUICK SCHEMES!! I hate those schemes like multi-level marketing, mail-order schemes, envelope stuffing scams, 900 number scams--the list goes on forever. I have tried every darn get rich quick scheme out there over the past 12 years. I somehow got on mailing lists for people looking to make money (more like "desperate stupid people who will try anything for money!"). Well, when I was a teenager, these claims to "get me rich quick" sounded irresistible! I would shell out $14.95 here, $29.95 there, $24.95 here, and another $49.95 there. I had maxed out my new Circuit City Card AND my Visa...I was desperate for money!! So, I gave them all a chance but failed at every one of them! Maybe they worked for some people, but not for me. Eventually, I just tossed that JUNK MAIL in the trash when I got the mail. I recognized it right away. I can smell a money scam from a mile away these days. I thought I could sniff out a scam easily. WAS I WRONG!! I LOVE THE INTERNET!!!
I was scanning thru a newsgroup and saw an article titled GET CASH FAST!! I thought, "Here on the Internet? Well, I'll just have to see what schemes could possibly be on the internet." The article described a way to MAIL A ONE DOLLAR BILL TO ONLY FIVE PEOPLE AND MAKE $50,000 IN CASH WITHIN 4 WEEKS! Well, the more I thought about it, the more I became very curious. Why? Because of the way it worked AND BECAUSE IT WOULD ONLY COST ME FIVE DOLLARS (AND FIVE STAMPS). THAT'S ALL I EVER PAY--EVER!!!
Okay, so maybe the $50,000 in cash was a tough amount to

reach--but it was possible. I knew that I could at least get a return of $1,000 or so. So I did it!! As per the instructions in the article, I mailed out ("snail mail" for you email fanatics) a single dollar bill to each of the five people on the list that was contained in the article. I included a small note with the dollar that stated "Please Add Me To Your List." I then removed the first position name of the five names listed and moved everyone up one position, putting my name in position five of the list. This is how the money starts rolling in! I then took this revised article--now with my name on the list--and REPOSTED IT ON AS MANY NEWSGROUPS AND LOCAL BULLETIN BOARD MESSAGE AREAS THAT I KNEW.

I then waited to watch the money come in, prepared to maybe receive about $1,000 to $1,500 in cash or so. But what a welcome surprise when those envelopes kept coming in!!! I knew what they were as soon as I saw the return addresses from people all over the world--most from the U.S., some from Canada, and even some from Australia! I tell you, THAT WAS EXCITING!!

So, how much did I get in total return? $1000? $5000? Not even!!! I received a total of $23,343!!! I couldn't believe it!! I now have a brand new black Acura Integra to speak for due to this!! Now after almost eight months, I am ready to do it again!!! Maybe it is possible to get $50,000 in cash--I don't know--but IT COMPLETELY DEPENDS ON YOU, THE INDIVIDUAL!

You must follow through and repost this article everywhere you can think of! The number of postings you make will determine how much cash will arrive in your mailbox!! It's just too easy to pass up!!! Let's review the reasons why you should do this. The only cost factors are the five stamps, the five envelopes and the five one dollar bills that you send out to the listed names by snail mail (U.S. Postal Service mail). Then just simply repost the article (WITH YOUR NAME ADDED) to all the newsgroups and local BBS's you can. Then sit back and enjoy walking (you can run if you like!) down your driveway to your mailbox and scoop up your rewards!!

We all have five dollars to put into such an easy, effortless investment with SPECTACULAR, REALISTIC RETURNS OF $15,000 to $25,000 in about 3-5 weeks! So HOLD OFF ON THOSE LOTTERY NUMBERS FOR TODAY, EAT AT HOME TONIGHT INSTEAD OF GETTING TAKEOUT FROM McDONALD'S, AND INVEST FIVE DOLLARS IN THIS AMAZING MONEY MAKING SYSTEM NOW!!! YOU CAN'T LOSE!!

So how do you do it exactly, you ask? I have carefully provided the most detailed, yet straightforward, instructions on how to easily get this underway and get your cash on its way. SO, ARE YOU READY TO MAKE SOME CASH!!!?? HERE WE GO!!!

INSTRUCTIONS:

1. Take a sheet of paper and write on it the following: "Please add my name to your list." Make sure you also include your name and address. This creates a service out of this money-making

system and thus makes it completely legal. You are not just randomly sending a dollar to someone--you are paying one dollar for a legitimate service. I assure you again that this is completely legal!
2. Now fold this sheet of paper around a dollar bill (no checks or money orders). Put them into an envelope and send it on its way to the five people listed. The folding of the paper around the bill will insure its arrival to its recipient. THIS STEP IS IMPORTANT!!
3. Now, listen carefully. Here's where you get YOUR MONEY COMING TO YOUR MAILBOX. Look at the list of five people. Remove the first name from position 1 and move everyone on the list up one slot. Position 2 name will now move to the position 1 slot , position 3 will now become position 2, position 4 will become 3, position 5 will become 4. Now, put your name, address, zipcode AND COUNTRY in position 5.
4. Now, upload this updated file to as many newsgroups and local bulletin boards' message areas and file sections as possible. Give a catchy description of the file so it gets noticed!! Example: "NEED FAST CASH?, HERE IT IS!" or "NEED CASH TO PAY OFF YOUR DEBTS??", etc. The more uploads the more money you will make, and of course, the more money the others on the list will make too. LET'S ALL TAKE CARE OF EACH OTHER BY BEING HONEST AND BY PUTTING FORTH 120 PERCENT INTO THIS PROFITABLE AND AMAZING SYSTEM!!! You'll reap the benefits, believe me!!! Set a goal for the number of total uploads you'll post, such as 15-20 postings or more! Always have a goal in mind!!! If you can UUE encode the file when uploading, that will make it easier for the people to receive it and have it downloaded to their hard drive. That way they get a copy of the article right on their computer without hassles of viewing and then saving the article from the File menu. Don't alter the file type. Leave it as an MS-DOS text file. The best test is to be able to view this file using Microsoft's Notepad or WordPad. If the margins look right without making the screen slide left or right when at the ends of the sentences, you're in business!
5. If you need help uploading, simply ask the sysop of the BBS, or "POST" a message on a newsgroup asking how to post a file. Tell them who your internet provider is and PEOPLE WILL ALWAYS BE GLAD TO HELP. I would try to describe how to do it but there are simply too many internet software packages with slightly different yet relatively simple ways to post or upload a file. Just ask for help or look in the help section for "posting." Place a one-line statement in the main body section of the message post screen. Something like "Download this to read how to get cash arriving in your mailbox with no paybacks!" or whatever. Just make sure it represents its true feasibility, NOT something like: "Get one million dollars flooding into your mailbox in two days!" You'll never get ANY0 responses!
6. And this is the step I like. JUST SIT BACK AND ENJOY LIFE BECAUSE CASH IS ON THE WAY!! Expect

to see a little money start to trickle in around 2 weeks, but AT
ABOUT WEEKS 3 AND 4, THE MONEY STORM WILL HIT
YOUR MAILBOX!! All you have to do is take it out of the mailbox
and try not to scream too loud (outside anyway) when you realize
YOU HIT THE BIG TIME AT LAST!!
7. So, go PAY OFF YOUR BILLS AND DEBTS and then
get that something special you always wanted or buy that special
person in your life (or the one you want in your life) a gift they'll
never forget. ENJOY LIFE!
8. Now when you get low on this money supply, simply
re-activate this file again, reposting it in the old places where
you originally posted and possibly some new places you now know
of. Don't ever lose this file. Always keep a copy within reach for
when you ever need cash. THIS IS AN INCREDIBLE TOOL
THAT YOU CAN ALWAYS RE-USE TIME AND TIME AGAIN
WHEN CASH IS NEEDED!

****

NOTE: Keep a list of everyone that sends you a dollar
(remember, they asked you to add them to your list) and always
keep an eye on the local postings of this file, just to make sure
that everyone is playing the game fairly. You know where your
name should be. AGAIN, HONESTY IS THE BEST THING
WE HAVE GOING FOR US ON THIS PLAN. By the way, if you try
to deceive people by posting the messages with your name in the
list and not sending the money to the people already included, you

will not get much. I know someone who did this and only got about $150 (and that's after two months). Then he sent the 5 bills, people added him to their lists, and in 4-5 weeks he had over $10,000!

I have a Storno 440 (PRM3663D15B) carphone and I want to use it for
packet on 70 cm.

Does somebody have any experience in moving it to 70cm.

Maybe there is also a Motorola version of this set.

Therefor some details:

The PLL is a MB1504L, IF stage: 185 77M67 KLKI18934
RF PA: Motorola: MHW720A2

Cellular chipset: Motorola/VLSI/CML
ZC80556FN / XC390064FN / XC68SEC811E2FN
EPROM is labeled:: Motorola A/S CCVN 4012A

The circuit diagrams are also very welcome.

output of
>my receiver. What modifications will I need to make in order to do
so?
>Will I need a 10 MFD cap between the discriminator and interface?
Will I
>need to replace any resistor(s) on the interface?
>
>- CrACKeD

Hello,
It is always a good thing to isolate the tap from the receiver. It
would be a good thing to use a small cap (say .001 or .01Mfd). I am
going to add taps/outputs for baseband and IF on my PRO-2005 soon and
do not want to cause any damage to the receiver. The audio/RF signal
(AC) will pass through a cap so this would probably be best. As to
loading down the circuit, I do'nt know. Hopefully someone else with
some more info will answer this post and set us on the straight track.

Best Reguards,
Jerry

From: Jeff Goebel <jgoebel@rrnet.com>
Message-ID: <01bc2cdc$d5f40e60$63b70bce@cathy>
Source record: 31144

I can't seem to get data from the GPS unit to the TNC.

I have a KPC-9612 ver 7.0 and a Garmin 45. I have the tnc in the GPS mode, have set the parameters for LTP, BLT, gpshead, etc.

I get beacons containing the LT text, but no gps data. I have the Kantronics HSP cable but have also tried connecting data out and ground from the G-45 to the 9612 pins 3 & 7 directly.

I have the garmin set to NMEA 4800 baud plus the mode on the KPC-9612 at 4800,9,n,1.

what am I missing?
I can get streams of data when using the garmin on a sereal port with other software.

1543. FTV = WEFAX-FAX-SSTV-RTTY with SoundBlaster

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-09 00:00:00 UTC
From: "Brian E. Cauchi" <gcauchi@keyworld.net>
Message-ID: <01bc2cd3$3ce08540$0101a8c0@gcauchi.keyworld.net>
Source record: 31147
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc, rec.radio.amateur.space

Hello... Brian here!

If you have a RADIO and a SOUND BLASTER (or compatible card) you already have all the hardware necessary to:

RECEIVE - WEFAX, FAX, SSTV, COLOUR SSTV and RTTY
TRANSMIT - FAX, SSTV and COLOUR SSTV

*** Put the power of your 80386, 80486 or Pentium processor to real use ***

The external "decoder" units that are used by conventional users are modelled inside this software. This makes it easy to get started, inexpensive and rids you of the inevitable tangle of wires and boxes of decoders.

Absolutely no external hardware, other than a simple audio lead, is required by FTV. The current version decodes:

WEFAX (from weather satellites, e.g. 137-138 MHz)
HF-FAX (from terrestrial stations)
SSTV (from radio amateurs, e.g. 14.230 MHz)
RTTY (press, naval, weather etc)

Here is a run down of the more interesting features:

(1) It keeps the demodulated signal in memory, so that the signal can be analysed again at a different keying rate or polarity! Garbage can be resampled on the fly, which means that minutes of received signals decoded at the wrong baud rate or keying polarity are recovered, on the fly, while still receiving.

(2) The incoming signal is analysed automatically - standard modes, line rates, baud rates and keying polarity are automatically determined following analysis.

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

*** What are you waiting for? Try it now! ***

Take a look at my web site for futher details, from where you can download an evaluation copy, at: http://www.geocities.com/SiliconValley/2504

Registration promotes the further development of this software and entitles the user to future upgrades paying only for delivery expenses, if any.
Current release is 0.98f

Finally, just in case some of you have trouble accessing my web site, here is my postal address (if you want a reply, send a self-addressed label and IRC's to cover expenses):
Brian E. Cauchi,
Gawhra, Domenico Cachia Street, Birkirkara BKR06, MALTA.

What can I say? Try it, and may you have as much fun as I am having...
73's from Brian.

From: "Brian K. Short"
Subject: APRS 30m QRP Test

Many of you may be familiar with APRS especially since the
recent articles in QST and other publications. This software
is available for DOS, MAC, and Win 3.1/95.

The way it works is that you mostly monitor for packets which
contain position (location) or WX information, but occasionally
you transmit packets of your own containing information about
your own station. When you do, the information pops up on the
screen/map of all the other monitoring stations. Some stations
connect GPS units to show position changes in motion...

What does this have to do with QRP? Well, first of all the power
and antenna gain are ALREADY a part of the beacon information...
Second, folks are interested in portable/mobile configurations that
can be devoted to APRS operation: palm-/lap-top computer, HF packet
TNC, radio (and possibly GPS).

So far, I have used my FT-990DC/PK-232/half-sloper at 5w and have shown
up on maps around the US. Watch for my "QRP APRS" operation on 30m
(10.151
lsb).

Subject: FUNET archive mirror for Asia.

Hello, OM.

The `Funet' has one of the most famous hamradio archive from the
beginning of the Internet. From last year, a mirror of Funet archive is
established in Ring project, Japan. This mirror distributes only Funet
original area, but ucsd.edu is nearer than Funet from Japan, and Asian
countries. :-)

Subject: Help, new to packet!

Hi All

I'm new to packet and have a question. I've got a r/s HTX-202, a KPC-3 and a 286 laptop. Unfortunatly, I only have the Pacterm program that came with the KPC-3. Its driving me nuts because 1) it seems to disconect whenever the node is slow to respond, and 2) lines will go to fast to read and are lost. Is there a better program thats readily available? Thanks and thanks for putting up with this kind of basic question!

[snip]

I'm not sure that I really understand your question - KISS is a mode
of TNC operation that essentially removes all of the AX25 functions
from the TNC and reduces it to a box that translates an 8-bit asynch
stream on the "computer" side to HDLC frames on the "radio" side, and
vice versa. No driver is needed for this - you could use a simple
terminal program like Procomm to send KISS frames back and forth
to the TNC. The hard part would be writing the program (or Procomm
script language file) that would do the AX25 protocol stuff.

At any rate, you can find a complete description of the KISS protocol
in a file which is a collection of NOS info, called KA9QBGN.ZIP. It
is about 190 kilobytes long. One of the files it contains is called
KISS.TXT by K3MC and KA9Q which is a full description of KISS by the
"inventors", about 25 kilobytes. The KA9QBGN file should be at TAPR,
somewhere, although I don't have a directory for it. A few months
ago it was at HAM-server URL http://www.ati.com/hamserv in Directory:
/hamradio/packet/tcpip/docs/. It is also at all Simtel sites in the
simtelnet/msdos/tcpip/ directory. I can send you the KISS.TXT file
via Email if you like.

If you're looking for information on the AX25 protocol, the definitive
source is _AX25 AMATEUR PACKET-RADIO LINK-LAYER PROTOCOL_ which is
published by ARRL, for a few dollars. I believe it is also available
from them via ftp and/or Email server.

There is an example of Pascal source code that can decode AX25 frame
"header" fields in the BPQCODE package in a file called TERM4.PAS.

I hope that some of this, at least, gets you pointed in the right
direction. If you can be more specific about what you want to do,
send me a note and maybe I can help. Good luck - 73

==========
NEW RemoteGateway.Packet/Tor, FREE SOFTWARE OFFER !!
INFO pr Feb, 18th 1997:

SYNAPSE 0.43 is a multimode/crossband VHF/HF gateway and remote radio rig
control program just ready to be released these days.

The program is made by LA7XQ Steinar Wenaas, and it's FREEWARE.

SYNAPSE provides you REMOTE operating a KAM TNC, a HF (or VHF) radio on a
fixed or variable HF frequency from any VHF/UHF AX25 site based TNCs attached
to any PC or even a dumb terminal. You're then acting as a SYNAPSE CLIENT
and the remote KAM is your HOST.

The VHF (or UHF) user will be offered typical HF digital ARQ modes like
AMTOR, PACTOR and GTOR even he's miles away VHF FM client only!!

This version lets you remote control frequencies/modes/SWR/S-meter etc. on
KENWOOD HF radios from VHF. You may also remote control other gears like HOST
antenna relays, burglar alarms, power switches, modems etc. all from
the VHF client site or through telephone lines (remember in the latter case
you're not a radio ham forwarding hot spot nodes any more).

SYNAPSE also lets you miles away listening ongoing QSOs in AMTOR/PACTOR
or GTOR (the latter mode requires a KAM 8.0 or KAM+ to the PC interconnect).

You may also stay connected STANDBY in TOR mode ready to be LINKED to from
other HF stations and at the same time be able to watch FEC CQ calls.

SYNAPSE offers the possibility REMOTE receiving and forwarding BROADCAST
modes like RTTY, ASCII, FEC (AMTOR = GTOR = TOR type) or the special PACTOR type
FEC which runs 8 bits operation. This modes converts to the AX25 VHF streams
as well.

Extra service - Callbacks:

Operating the KAM through SYNAPSE is done very much the same way as running
HF modes locally on KAM in terminal mode, hence prefixed commands are given
and you may run SYNAPSE help or control commands in parallel with your -TOR
mode QSO operation. These commands have local callbacks reporting TNC
status etc. back to the VHF/UHF client while operating.
Your commands are then prefixed and they are attached to a dispatch list
while you're operate.

Many more commands are at your service, among some of many ON/OFF here:
* Automatic return into TOR after ending a QSO in any ARQ mode.
* Automatic seizing the link whenever you type. If OFF you may use type-ahead.
* Automatic flags showing link direction. ON or OFF at your choice.

Other options:
* Automatic generation of AMTOR SELCAL from a given amateur callsign.

* Automatic sending of correct CQ calls on HF for you (by a simple command).
* Link hand over with automatic call sign exchange.
* Link close down with automatic call sign, time and date.

At any time during a QSO you can ask "help" commands or information about bytes still to go, link quality, direction, speed, or change your atomization level of the program.

When no VHF/UHF user is connected, the KAM ARQBBS (HF mailbox) is set ON. HF callsigns are then switched back to default (defined by Host owner in a configuration file) and KAM is set into TOR STANDBY mode again.

REMOTE operation does not mean from a PC close to the HF radio only. It means remote operation miles away from the HF radio QTH by using the AX25 packet radio protocol on VHF or UHF.

SYNAPSE is then very suitable for EMERGENCY communications providing the rescue headquarter the full possibility to operate long distance HF PACTOR protocol from a site where no HF power or antennas are reachable.

Minimum hardware at the HF radio QTH are:
* Any HF rig. SSB radio mode using AFSK or RTTY mode using FSK.
* Any DOS PC with 1 RS 232 COM port. Recommended CPU 386 DX and upwards.
* Slower PCs may work in pure PACTOR QSOs.
* KAME or KAM+ version 7.1 and upwards.
* Any VHF/UHF FM rig.

Minimum hardware at the VHF/UHF radio QTH are:
* Any VHF/UHF radio to be operated by an AX25 packet TNC.
* Any AX25 packet TNC, even BAYCOM 'TNCs'.
* Any terminal, or PC with any communication program to operate the AX25 packet TNC.

As mention this version 0.43 of SYNAPSE offers the possibility to completely remote control KENWOOD radios on COM port 2, change frequency etc. etc.. This requires that the PC at the SYNAPSE/HF-QTH has an extra EIA RS232C COM port. Even other equipment may be controlled, ex. by COM port 3 and 4, as power supply switching HF radio, burglar alarm/warnings or antenna relays.

(LA7XQ have also made a burglar system (for club stations or home) that automatically produces a message in the HOST mailbox itself when the intruder comes. As a remote client you may then check if any intruders has innovated your premises at the club station.
A corresponding client program at home may periodically also checks that mailbox if you want even more automation.
Is this something for you too?)

A coming version of SYNAPSE will incorporate full ICOM radio rig protocol as well because LA7XQ has an ICOM-706 himself so this transceiver will be paid special attention to next time.

Other gears like YAESU rigs may come later if hams out there are interested.

SYNAPSE lets a HF station either link to the ARQBBS with Host owner call sign when no remote packet station is connected, or link to the already

connected packet station staying standby in TOR.

Later versions of SYNAPSE may also incorporate possibility for a HF PACTOR
or GTOR station to link to SYNAPSE from the HF side and in addition connect
further on to the local VHF/UHF packet network.
We are working with that now.

SYNAPSE 0.43 FREEWARE is available on the following URL address:
http://home.sol.no/stwe

1545. AEA - the future?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-10 00:00:00 UTC
From: David Wood <david@wood2.demon.co.uk>
Message-ID: <XxQZDBA3LEJzEwd9@wood2.demon.co.uk>
Source record: 31007
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

I was at the London Picketts Lock Rally on Saturday, and got talking to some of the folks on the SMC stand. As a throw away comment, I asked if AEA had a future, and some chap in a suit got up, and said that they'd tried to buy it, but were too late.

Apparently, SMC got there with a bid - too late - as Timewave (of the DSP filter fame) got there first. I understand that what they were fighting over was the DSP232. I was also told that it was the antenna products that caused their commercial failure - they simply had too many products over too many areas, and their business became too diverse. The TNC lines seem secure, however.

So, if this is true (and it came from the horse's mouth, so to say), it seems as if AEA's TNCs will reappear from Timewave, though whether the non-DSP stuff will be supported and developed is entirely another question...

FWIW, IMHO etc.

KPC-9612 TO THE GARMIN 45

From garmin cable to the DB-25

Brown Wire NMEA OUTPUT to Pin #2
Black Wire (GROUND) to Pin #7

COMMANDS:

BLT 1-4 space 15 or 30 seconds apart
GPSHEAD 1-4 $GPGGA
LTP 1-4 aprs via your digi
LT 1-4 none
BTE default beacon text
UNPROTO aprs via area digi

TAKE NOTE:
TNC BAUD RATE MUST EQUAL THE GARMIN'S BAUD RATE (4800)
TNC MUST BE IN IN TERMINAL MODE NOT THE DEFAULT NEW USER MODE
GARMIN 45 INTERFACE MUST BE SET FOR NMEA/NMEA

FINAL TNC COMMANDS:
INT GPS
THEN TURN THE TNC OFF. TURN IT BACK ON AGAIN AFTER FIRST TURNING ON
THE GARMIN. WATCH FOR XMIT LIGHT ON TNC AND RADIO TO KEY UP.

> net.

One caution with the Yaesu-5100: the data jack in the
back has a problem with severe transmit frequency response
roll-off. If you feed 1200 baud tones into it, you will need
to build an audio equalizer to make it work. About +6db of
upslope from 1200 to 2200 hz seems to work fine. The receive
response is flat (no problem). The roll-off is so bad, that
even 300 baud packet is problematic through the data jack, and
9600 baseband FSK is not workable (well, at least on mine).

1554. PK232MBX + Yaesu 747GX + Software.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-10 00:00:00 UTC
From: djs26@po.cwru.edu
Message-ID: <5g17ie$anr@alexander.INS.CWRU.Edu>
Source record: 31155

I recently picked up a PK232MBX at a hamfest for a good price.
I knew it was a gamble but after bringing it home and testing it on 2M packet
recv/xmit it appears ok.
Next I tested it on HF using my Yaesu 747GX recv only and I copied
AMTOR/RTTY/PACTOR ok. So time to wire it for xmit. Well when I
follow the info in the book and xmit my ALC/Power meter pegs
full scale with very little mike gain. Well I began to wonder
if there's DC getting into the mike input from the PTT circuit.
So I'm posting this Q?

Has anybody wired up a PK232MBX with a Yaesu 747GX and had to use
a capacitor or resistor combination to isolate the mike input from
the PTT circuit? If so what values? I'm guessing .1mfd in the
mike input and maybe 33k in the PTT lead..

Software? I'm using PakRatt for DOS but would like to use a
Windows version. Any links to good software would be appreciated.

Looking for my first RTTY/Amtor/Pactor QSO!!!!!!!

Thanks,
Donn
KC8CTP

Take a look at the back of the PK232 and check
the level adjustment of the TNC. You may just need to
turn this down. I used the PK232 that I own with a FT767
for several years and never had any problems.

I am currently trying to run JNOS (the latest version) with my Baycom. I specifically got this version of JNOS to work with Baycom. It works ax.25 great; unfortunately, whenever I try to do a NOS command (such as telnet, ftp, or so on) It will display the message "trying 44.32.1.80. . ." (for example) and then I get the message LIMBO! err. no 219. What does this mean. Thanks.
John Meyer, KB0OLD

1560. ICOM IC-R7100 commands?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-11 00:00:00 UTC
From: rob@pe1chl
Message-ID: <E6vvDy.CJE@pe1chl>
Source record: 31014
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I am looking for the complete CI-V command set of the IC-R7100 receiver.
It is no problem to find general docs about CI-V, so I have already built
an interface and have written a simple program that displays the frequency
and mode when the receiver stops scanning.

However, I would like to control the AF GAIN depending on the frequency
where the scan stopped. It is possible according to the user manual, and
there even is a LED on the front panel that is supposed to indicate that
the AF GAIN is being remotely controlled.
But, this command does not appear in the generic CI-V documents that I
have seen.

Does anybody have a complete IC-R7100 command set, or know where one can
be obtained?

Thanks for reading this.

Does anyone have any information on getting a AEA PK-87 to work in KISS mode? The ROM appears to have the kiss commands, but on entering them, the tnc stays in the normal mode. I thought the PK87 did not have KISS, but it seems strange that the commands are in ROM.

>question...

Just a note to say that I have received a private email from someone
connected with AEA to say that there are many inaccuracies in my
original report. I'm not surprised - the true details will, I'm sure,
emerge in due course. I wasn't claiming accuracy in anything - unless
you were there, you are unlikely to have the full story.

The good news, however, it that it seems as if AEA's excellent range of
TNCs will reappear soon - it's just a shame that the company ran into
trouble, because they had good products.

ICOM America sells a book titled the CI-V Reference Manual for $ 15.00
plus shipping and handling. It does have the commands for the R-7100
included in that book. Later radios now have the command sets
included in the instruction manual for each radio.

Don't get too happy. I just got an R-8500, and the listed control codes are <WRONG> They don't work. I wasted a whole day on it, then after much "please hold" from Icom, they tell me "Oh, you need the old codes, they are in our extra book."

Whathell is going on here? That RX wasn't on the shelf for more than 2 weeks, and they are telling me that the codes on the printed manual (that takes about a month lead-time) are NEWER than the software in the rig???

After waiting another day for fedex, finally I have the right data in hand. What a mess!

It's a nice rig, but as usual, the manuals bite.

Message-ID: <dick-ya02408000R1203970940450001@news.zippo.com>
Source record: 31028

Earlier this week I posted a question asking whether there were any retail sources for Peet Bros WX equipment, in the hope of finding a better price than going straight to Peet Bros. Someone was nice enough to tell me that Ham Radio Outlet sold Peet Bros WX gear.

I went to the HRO web site and checked their prices. They are the same and in some cases slightly =higher= that Peet's list prices! So much for trying to save a little money.

If anyone else is aware of alternate (legitimate) sources of Peet Bros WX gear, I would still be interested.

I know from the docs on KISS mode that it does not allow you to have
software-based flow control. But my question is whether hardware
based flow control is supported by TAPR-2 TNC's (like the Tiny-2)
when operating in KISS mode. Or do I need to make sure that I don't
send data to the TNC faster than it can pump it out the other end.

Thanks,

John Hansen

1577. XPWIN - How to access the PACKET connect list?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-13 00:00:00 UTC
From: wkebsch@news.sni.de
Message-ID: <5g8mpl$mau@linus.pdb.sni.de>
Source record: 31031

Hello,

since few days I am evaluating XPWIN from XPWARE. It's realy a good program
and I am thinking about to become a registered user of it. Because I have
a little problem I have e-mail'd my question to the author of this program
and hoped to receive any answere. Until now: nothing! That makes me very
sceptical, if it is a good idea to put out the mony for a registration. So
I would like to know, what is your experience with the support of XPWIN
by KF7XP ??

Maybe anyone of the more experienced users here knows the resolution of my
little problem? Please read the following e-mail which I have sent to KF7XP
recently.

73 de Waldemar, DK3VN (mailto: wkebsch.pad@sni.de)

PS: My e-mail to KF7XF was ..

---------- SNIP ----------
Hello,

since few days I am evaluating XPWARE for Windows, Ver.-1.1.5
which I have downloaded from your Web side recently.

I am very pleased with the software, but have a little problem,
which I can't resolve. How to get access to the packet connect
list? I have tried everything, I believe, studied the documentation
(help files) again and again, but don't found the way how to do
it. For me it is an absolute important feature to have access
to a DX-cluster parallel to my PACTOR or RTTY activities.

Maybe it will help you to find the solution for my little problem,
if I would give you a description of my station and the environment.

My TNC is a brandnew PTC-II from SCS with one PACKET 9K6 modul at
the packet port #1. The HF-port of the TNC is connected to my
HF-radio (IC-736) and the PACKET-port to my UHF/VHF-radio (IC-820).
The PTC-II has a remote control feature, but currently I have not
wired it with my ICOM radios. The PTC-II is connected to my PC via
COM-1, 9k6 like a modem (1:1).

If I am running a HOST mode program for PACKET-TNC's I can access
the packet modul and establish several packet connects on the same
UHF/VHF frequency without any problem.

XPWARE runs on a Pentium 90 MHz, 16 MB RAM and WfW-3.11.

---------- END ----------

No the commands are correct except for one and that addendum should
have been included with your radio, if not contact ICOM for it. Many
software companies are not haveing troubles with wrong commands in the
R-8500.

I used an earlier Sharp Wizard succesfully. With a HH and a KPC-3 running without the LED's on, it made for a very compact, low power drain station.

I used the Wizard to PC cable, with a "null-modem" adaptor into the tnc. Mine had a 40 ch screen. I used the simple terminal program built into the Wizard. Make sure you set it up so it is connected, & doesn't want to dial out, and that you have the right speed from tnc to Wizard.

Unfortunatley, the Wizard no longer works, and I haven't taken it in for repairs. (The problem has nothing to do with the ham radio useage!)

It's more than one. I don't have either the rig or manual at this
location yet, they are with the programmer, but I'll detail what
was different as soon as I can.

Maybe I'm picky, but I called ICOM to verify the manuals, and
specifically
asked for addendums or changes, and was told there were none.
Much hair pulling later, they remembered this tech manual with
what they called "the old codes" and claimed the manual
documented the "new codes".

All I know at this point is the programmer is running just fine now,
and I expect a beta version probably next week.

Maybe someone can post the commands from an R-8500 manual, so I can see
if the R-7100 uses a subset of those commands?
(or even better: the R-7100 commands as listed in that Icom ref manual :-)

Some firmware may do (undocumented) RTS/CTS flowcontrol...

>Or do I need to make sure that I don't
>send data to the TNC faster than it can pump it out the other end.

... but you will need to do that anyway!
The amount of bufferspace in the TNC is unknown, and you will probably
cause problems by sending all the time (PTT watchdog timeout, etc).

Normally the AX.25 or TCP protocol will act as a flowcontrol mechanism
because it has a finite window of outstanding (unacked) data.

From: arpad@tezcat.com
Message-ID: <5g9vmq$75o@chinx10.tpa.net>
Source record: 31037

A client of mine is planning an expedition to the North Pole
and would like to have Internet connectivity from a laptop.

Packet radio is my last hope but I have no clue. Can someone
point me to some beginner's resources please. I've found plenty of references
for the necessary software but don't have too much information
on the required hardware.

Alternately, if someone out there would like to be hired on as a consultant
for this, I can discuss that option with my client.

Please email replies.

Thank you.

In the Menu Bar select "Misc" and then "Connect List" (last item on the list). You will then have to add the staions you wish to connect with on a regular basis.

It is a fine program, by the way...

Body handling: 1 inline base64-encoded payload block was not displayed

Howdy all...

I was recently looking at the circuit posted in the ARRL Handbook, 1996, page 12.44 (article starts on page 12.39). This circuit is designed specifically to modem SSTV and FAX images with a minimal of cost. However, I noticed that the frequency range of this little circuit easily encompasses those frequencies used by ordinary, 1200bps packet radio.

Thus, I was wondering what frequencies are used to represent a binary 0 and binary 1 for VHF AFSK over 2m FM. I was also wondering if anyone already has tried to use this little circuit for working with packet; if so, please drop me a line!! :)

Thank you for your time and assistance.

I am considering getting started with packet on 2M. And have two general questions:

I'm in the Sacramento area and have not yet heard a 9600 baud _sounding_ signal.
Is 9600 baud still experimental or is it a realistic good investment for a new modem
purchase?

I have a WIN95 laptop that can be dedicated to my radio. Is there TNC software
available anywhere that is windows based and full featured? Likewise, a modem
that is optimized for use by computer software?

Thanks for your help

The CI-V reference manual listed commands for all prevoius radios that
had the CI-V command set available to them.

It is recommended to those whom need some more assistance with the
command set that the radio instruction manual provides. The CI-V
Reference Manual goes further than the product instruction manual does
in explaining the commands and how they are used.

The CI-V reference manual is for out of date radios. Now ALL of the
commands are in the radio instruction manual. One will need this CI-V
Reference manual for writing programs for radios prior that the
IC-820H.

And yes all of the available commands are in the R-8500 manual and
are correct except for ONE command. ICOM is correct there are no
updates for the command set on the R-8500. I know of 4 programmers
who are NOT have any difficulity programming the R-8500 with the

supplied command set in the instruction manual. Geez even U.S. government agencies are finding the command set to work fine.

I would be interested in your findings, please report them to 75540.525@compuserve.com

>UHF/VHF frequency without any problem.

Which program are you using for HOST mode. I was unaware
of none that supported the HOST mode in the SCS other than WinLink.
I would guess that most DED programs could access the ports, but theere
would be more way to send commands.

There are several items that are currently missing in the HOST mode
to make it 100% reliable. I have been in contact with SCS
on this issue.

Until they have a host mode that supports echo of transmit data, an easy
method
to interogate and send TNC commands etc I will not be able to offer
support for the host mode or packet in the PTC-II. I have tried implementing
packet in command mode, but there is lack of a prefix character to
separate the packet data from the HF data. If there is binary data
being sent on a packet channel this data can be easily mixed with the HF
data.

I have a PTC-II here with both ports and have been waiting since 2.0
was released for further progress on the host mode. It appears at this
time that SCS is perfecting the host mode for WinLink. I hope that they
will add these necessary features to the firmware as soon as possible.
It is an amazing TNC!!

Is your client looking for a realtime connection or for mail and news?

Is this a commercial venture or is he a ham radio operator wanting
this for personal use?

What are the weight, bulk, and power considerations?

I believe the only practical connection could be obtained via the use
of satellites (and this is possible via both amateur and commercial
services), but before folks begin consideration, you should answer the
above questions.

Hi,
Is it possible to use a normal modem like the one I am using for
the internet, on packet radio.
If the answer is yes Please any one can tells me how,and also the
modem parameters

Many thanks from 9H5AB

Check out the USRobotics Pilot.. It fits in a shirt pocket, has a
terminal emulator and standard serial port and works very well on any
Packet TNC.
You can also write your own programs for the unit when you want a more
comfortable interface. And it is cheap...

They have a web page at http://www.usr.com/palm

I use Linux, and my friend Windows NT 4.0

We would like to connect each other via packet radio, over TCIP/IP protocol (we can not connect with Ethernet, because he is 4 KM (2 Miles) far).

I would also like to know, is it posible to connect our network to Internet.

We are interested in speeds of 9600 or greater, but 1200 or 2400 would be fine for a start.

Matt,
When you say connecting two computers, there are a range of different methods.
For example, do you want something to act as a tcp/ip socket, or do you want
something to look like a modem on the com port, etc. You need to be a bit
more specific. Then you can look for some driver software that will fit your
requirements. I suspect you will need something to handle data at a higher
level than provided by the Radiometrix packet controller interface; but
perhaps you should ask Radiometrix themselves. You have their web address.

You could try writing your own driver software, but this is a
task not to be attempted lightly.

LPRS Ltd. at:
http://www.lprs.co.uk/
supply a range of equipment from Radiometrix modules to spread spectrum
transceivers (2450MHz, to 1Mb/s, based on a design by yours truly) and have
some Radiometrix data sheets and application notes.

I'm trying to get the classification of tube types, e.g. 12AU6, 5U4GB, 4CX1500 etc. Each alphanumeric has a meaning. I believe 12 in 12AU6 means 12 pin but don't know the rest.

I've checked out a ton of web sites but have not been able to find the chart that describes the terminology. Anyone know where something like this exists?

1611. Timewave and AEA

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-16 00:00:00 UTC
From: jdreed@mindspring.com
Message-ID: <332bf961.10467208@news.mindspring.com>
Source record: 31065

The following courtsey of Ray W3HUV

I attended the Radio City seminar at Moundsview MN today and at 2PM
Mr. Randy Gawtry K0CBH, Pres. of Timewave Corp. spoke on the
integration of AEA product line into Timewave.

This is the flyer:

AEA INKS DEALS TO SELL PRODUCT LINES

Advanced Electronic Applications (AEA) has closed deals to sell its product lines to two other companies, but the AEA name will live on. Former Chairman Mike Lamb, N7ML, says AEA's line of antennas, antenna analyzers and cable-testing equipment was sold, effective March 7, to Tempo Research of Vista, California. Tempo will handle all technical support, warranty and after-warranty service and plans to produce the products in the antenna, antenna analyzer and cable-testing line that AEA had been producing before it ceased operation late last year. Tempo will continue the AEA name under a separate division. Lamb says he will assume a primary marketing position with the new division.

Lamb said he's excited about the prospect of continuing a role with a portion of the AEA product line that he had a particular interest in. He said he hopes to work on new product development as well.

Timewave Technology of St. Paul, Minnestoa- already a major name in ham radio gear -- is buying the rights to all other AEA products, including its digital line. But Timewave president Randy Gawtry, K0CBH, asked the amateur community to give the company a few weeks to set up the new product line before calling. "Watch our Web page," he said (its at http://www.timewave.com). Gawtry says a purchase agreement is in place, and Timewave is in the process of making the product line transition from AEA to Timewave and hopes to be manufacturing products soon.
Timewave will have the right to use the AEA name for one year (AEA model numbers will be continued, however). Gawtry said Timewave also will handle technical support and warranty and after-warranty service fo the new product line, which includes AEA's DSP-232 multimode TNC, introduced last year.

Callers to the former AEA number are now being directed to either Tempo or Timewave, as appropriate. Tempo Research is at 619-598-9677. Timewave's number is 612-452-5939.

following de W3HUV personal notes:
After snooping around Radio City's retail shop and purchasing an MFJ-1701 6-position Antenna Swtich I carefully navigated the steps to

the lower level where I found only 12 people attending the seminar. It was in close quarters so everyone was close the the podium.

Here are the notes I jotted down:

The first PK232 was manufactured in 1985. They manufactured approximately 75,000 of them.

Timewave expects to be 70-80% running with AEA product line in 3 to 4 months. 100% in one year.

some history: Timewave had 2 partners. Mike Lamb and "George". George passed away. Mike got a man to run the business. Mike went to Montana and found he couldn't run it remote from there. Mike came back in 95/96s, let the management go, looked at the downturn in the market, decided not to continue. 1995 market drop and Internet competition.

Timewave sold around 30,000 DSP's

The PK232 was manufactured in Taiwan and the company there folded so manufacturing was brought back to U.S.A. Start up too costly so PK232 discontued.

Timewave will support PK232 hardware and software.
They will not, however, manufacture anymore PK232's and no new hardware
or software upgrades planned. However, they are open to suggestions on how to improve hw and sw.

Timewave will repair and upgrade returned PK232's.

Timewave/AEA started negotiations Oct/Nov 96 after AEA declared bankruptcy.

At a peak AEA had around 25 people.

All Timewave product manuals are on the WEB Site and they "may" or "may
not" put AEA product line manuals in there too.

As an aside Randy said "All Radio Shack product manuals including schematics are on the Radio Shack Web site."

Timewave is not a big operation: 8 people now and may grow to 12 people
within a year depending on business.

Hope this has helped y'all !

>this exists?

In the case of many of the tube numbers, the first numbers designate the filament voltage. The 12AU6 is a 12 volt filament tube. The 5U4GB is a 5 volt filament tube and the GB stands for Glass Based as opposed to a metal shell version. An example of that difference is the 6L6 vs. the 6L6G in which the 6L6 is a metal shell and the 6L6G is a glass shell version.

Not every tube follows that convention. For example, the example you chose of a 4CX1500 is not a 4 volt filament tube. In this case it is a higher power transmitting tube with 4 elements inside, a tetrode, having a filament, a grid, a screen and a plate. Contrast that to a 3-500 which is a triode, having only three element types, a filament, a grid and a plate.

A reasonable source for information on many of these tubes is the older issues of the ARRL handbook. In the back, they have an index for the tubes listing the really important characteristics of them, together with the base diagrams so you can use them. Your local library might have copies of the older handbooks, or be able to get one or so on inter-library loan for you to use for research.

>4CX1500 etc. Each alphanumeric has a meaning. I believe 12 in 12AU6
>means 12 pin but don't know the rest.

No, the numeric prefix is the nominal filiment voltage -- 12 volts in the case of a 12au6 and so forth. The numeric suffix is the number of elements the tube contains. So a 12au6 contains 6 elements, most likely arranged as a dual triode. The filement doesn't enter into this element count unless it also serves as a cathode.

Unfortunately, this scheme isn't universally adhered to, and so there's not much that can be determined about a 4cx1500, 300b, or 6146 tube by the tube designation.

>I've checked out a ton of web sites but have not been able to find the
>chart that describes the terminology. Anyone know where something like
>this exists?

Since there's no consistent terminology, there's unlikely to ever be a chart describing it. I do recall someone saying that they were working on scanning in the descriptions of most of the tubes in the "RCA Receiving Tube Manual" and placing these on-line. I'm unaware of any comparable effort or reference work for transmitting tubes.

Sorry. Hope this helps.

>this exists?

Just adding to Mike's excellent explanation, in a 6AU6, the last
number, 7, usually indicates the number of elements. That tube has a
6 volt filament and 6 elements, a heater, cathode, grid, screen,
supressor, and plate. A 12AU7 is a dual triode, so the 7 stands for a
single filament, 2 cathodes, 2 grids, and 2 plates.

If you are looking for a LW BC SW radio with a timer and cassette tape recorder, there is a Taiwanese company by the name of "Sangean" makes one which is their model ATS-818CS. It is a very adequate radio for casual listening and includes a BFO so you can use it for CW and SSB. At one time Radio Shack bought one model from this company but I doubt if it was the one with the recorder. If you need their address, please E-Mail and I will see if I can find a distributer in the United States.

Best Regards

>Will my IC 2000H work ok with most TNC'S ?

As long as you have the wires correct, you shouldn't have any problems.
MFJ makes cables for the ic-2000 and just about every major TNC.

>Anything particular I need to be wary of?

Not that I can think of. I leave my ic-2000 on 24/7 and it's never
given me a bit of trouble. I leave the power set at 5W. 50W of power
might generate a too much heat, but I think the ic-2000 should be able to
handle it.

>I only intend to use it sparingly to see
>if I enjoy packet, and if so will get another radio.

As long as you don't need 9600 baud, the ic-2000 should make for a
great permanent packet radio. Relatively inexpensive, built like a brick,
and not much wasted on extra features you often don't need for packet.

>Also, any recommendations on used, simple TNC's would be
>appreciated.

I've been using a Kantronics KPC-3 and it's proven to be as reliable as
the Icom 2000

"Portable Packets" FAQ

The HP200lx stands in a class all its own; at $500 it should!
Note that items preceeded by a ' * ' are not found in the earlier
HP??lx models, the new omnigo, or MOST other 'organizers'
and can be found at some office supply stores or used at the
newsgroup comp.sys.palmtops

The HP200lx is a true microPC XT
IBM XT 8088 at 7.91Mhz
DOS 5.0 built in will run most standard DOS text or graphics programs.
CGA fully compatable; 640 x 400 (2c) 320 x 200 (4c)
(1) 10pin RS-232 serial port. connectors available.
(1) type II v2.01 PCMCIA slot (I have 2 10MB cardds and 1 14.4 modem)
uses 2 AA batteries .
tons of custom software/freeware/shareware for the HPs
see the comp.sys.palmtops newsgroup

I have run MS flightsim 4.0, jet fighter II, aprs, baycom, geoclock,
traksat (a graphical realtime sat tracker, updates every 4-5 seconds on
the HP acceptable in the field)
plus some useful organizer stuff. I mostly run in dos with Norton
Commander. I also
use it to access my internet account when traveling. email, newsgroups,
ftp, www, etc

Baycom is just a standard dos program. i just turn on the serial port,
hook up the tnc
and radio, and baycom.exe away I go! I can install to my hp by
serial cable and either
using laplink, dos interlink, or norton commander. Or install the
flash card into my
pcmcia on my notebook. the reinstall into my hp after loading from disk
to card.

any questions just ask. the serial port can be activated by a built in
dos routine, the controlled 'on-the-fly' by an internet available

program. we are even working on jnos with the baypac modem but jnos
should run with other tnc's if you get the correct 8088 version.

1- Can it work with a laptop instead of palmtop?
I use the same tnc-cables-radio- and files on my palmtop as well
as my Lifebook 520 laptop

2- Is the BP-2 modem compatible with any laptop PC?
as long as it is/has ... minimum (this is a yes)

DOS 5.0
RS-232 serial port
CGA compatable
300Kb RAM
500Kb disk space min (ie PCMCIA flash cards)

3- Is the software that comes with the BP-2 compatible with any windows
based laptop PC?

So far only WIN95 seems to handle the interrupts properly
Obviously DOS or a DOS window (W95 only)

4- Does the BP-2 modem run on batteries and what kind?

powered right off of the serial port <50mA

5- The connection between HT and BP-2 looks homemade from the picture in
the article. Has it been difficult to obtain and were connection
instruction present in the BP-2 package?

the instructions are included, this will work on yaesu FT-11, Radio
Shack HTX-202,
and if a stereo plug is used instead of mono for the speaker (not using
the middle
ring) it will work on Alinco DJ-F1T. These are my actuall runs.
take a typical phone cord. look at the end with the clip up. (ends are
reversed)

clip
_____/-------_____
black-red-green-yellow <- this will be the end you work with.

cut clip from phone cord leaving an amount of cord as your cable (I use
12" or less)
keep the cord under 3' to lessen interference. You need a standard
1/8" stereo or
mono plug for the speaker (green to speaker tip; black to barrel
ground). Red is
unused; while yellow goes to the mic-miniplug tip.

Now you just need a serial cable and serial=parrallel port-adapter from
radio snack.

The TNC comes with BayCom 1.4 but it has bugs. Baycom 1.5 is improved and is
on the internet. goto a web search engine and look for "baycom 1.5".
use the manual from 1.4 though as the manual for 1.5 is in german. the help file for 1.5 is in english.
print the 1.4 manual to learn the basics and print the 1.5 help file (TERMHELP.SCC) for specifics. I can always send you my config to help get you started.

Any questions feel free to ask

>
> Ive heard of some sort of HP palmtop, that is very small, that will
> work, but have no other information on it.
>
> Any thoughts/ideas/recommendations?

The HP-100/200LX palmtops are 80 character and will run
DOS applications. As such, you can run a BBS system like
MSYS without a problem and have k-nodes, net-nodes,
tcp-ip, conference, full bbs, forwarding, etc. This requires
a TNC like the small ones offered by Pacomm. Their smallest
is about the size of a pack of cigarettes.

1634. cheap wireless transmitter chip sets?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-17 00:00:00 UTC
From: Dave Marinelli <davemarinelli@lucent.com>
Message-ID: <332DA76F.2781E494@lucent.com>
Source record: 31088
Cross-posted to: rec.models.rc.misc,rec.radio.amateur.digital.misc

I am interested in adding a simple transmitter to an existing
circuit. Where can I find information or, even better, chip sets for
designing the type of simple cheap transmitter/receiver pairs found in
remote control garage door openers, car door openers, wireless home
security devices, etc. Ideally, the device would have as many as
128 independent addressing codes (or frequencies, if thats how its
done).

Thank you,
Dave Marinelli

Message-ID: <332EA51B.3E39@uakron.edu>
Source record: 30961

Does anyone have experience using the AEA DSP-2232 on pacsats?
My 2232 has Vers 7 gateway roms. When using the pacsat modem and
the 9600 baud modem with the IC-821 I can decode anything that I
hear. Problem is that the manual correctly says that the satellite
up/down output is not yet functional for these modems. Are there
later versions of roms which support this function? Do I have an
orphan which I'll have to replace?

Mel W8MV

You can use the COMMS program with your serial link adaptor
to hook up to a TNC or a modem. The comms program is in the
ROM of the psion but may need to be loaded through the load
application function to appear on your desktop. Works great
on mine. 73, Joe

AmSoft announces the 1997 release of "The World of Ham Radio
CD-ROM.
The World of Ham Radio contains the World's largest collection
of amateur radio software, and the most recent FCC amateur radio
license database available anywhere. Track all US and Foreign
Licensees authorized to operate by the FCC. More than 1,000,00
callsigns are found in seconds with this CD-ROM. The current
database includes calls issued up to 14 January 1997. Find hams
by full or partial call sign, prior call sign, last name, first
name, State, City or zip codes. Create your mailing lists or just
print single labels from this FCC Callsign database program.
DOS, Windows 3.x, and *Windows 95 compatible lookups on this
CD-ROM.
Every issue comes with the AmCall auto-logging station logbook
which uses this callsign database. Compatible with most other
amateur radio software packages available today. Also includes
all the "Vanity Flood Gate assignments, plus the missing 3,500
"Vanity Assignment still Available" calls.

There are over 2150 amateur radio modification files included on
this CD-ROM logically arranged by manufacturer, and model number.
That's over 800 new mods since our last issue.

This CD-ROM is non invasive to your drives, this means no hard
drive usage unless you decide to use it.

A Complete user interface "CDVIEW" for the Ham Radio Software
library eliminates the need for you to use DOS commands and
hard drive space. CDVIEW includes Instant online help and
program documentation by pressing the (I) key on your keyboard.
CDVIEW will make it very easy for you to move through and
operate
the massive 20,000+ file compilation. These files could easily fill
822+ Megabytes of space if they were not on this convenient

CD-ROM.
Users can preview new ham software directly on the CD-ROM
without
requiring a hard drive, many of the software programs run directly
from the CD-ROM. You can use the CD-ROM to place files onto
removable diskettes, or to install files onto your computer.

For more information visit: http://hamster.ivey.uwo.ca/~amsoft/
or contact AmSoft direct from the information at the top of this
notice.

Hi and thanks for reading this message. I have currently run across this problem and have gotten conflicting answers. When you set up your TNC for KISS mode, do you use the RESET command or the RESTART command?

Use the RESTART command. The RESET command will reset all of your tnc
params to default. Such as MY nocall and the likes.

>tube by the tube designation.

Well, that isn't totally correct. The "4" in 4CX1500 refers to the number of elements, less the heater. A "4" is a tetrode - cathode, control grid, screen grid and plate. A "3" is a triode, and a "5" is a pentode. The "C" means ceramic construction as opposed to glass, and the "1500" is the plate dissipation in watts. I don't know if the "X" means anything or not.

As for the 300b, 6146, etc, you're right - no information there.

From: winston@cyber-wizard.com
Message-ID: <5gnf1d$kvb@informer1.cis.McMaster.CA>
Source record: 30963

Hi there,
I am a final year student in EE. I am working on microwave links at 38.7GHz for my thesis. The antennas system that we use are built by Harris. It is called the "Microstar".
I would like to know more about the advantages and disadvantages when connecting at such a high frequency in telecommunication.
I am also studying the attenuation and effect of such frequency when it propagates through various type of glass,vegetation and weather.
I am trying to use some formulas in order for me to verify my experimental result with the theoretical result. However, I am not sure about which formulas in optics or microwave that I can use.
If anyone of you have more to say about this, please send an email to winston@cyber-wizard.com . Any other information would be greatly appreciated.

BTW, I hope I am posting up in the right newsgroup. If not, I would like to apologize and please suggest the right group for me. Thanks.

** I have limited excess to newsgroup, so please replying by sending an email to me.

Thanks you for your attention.

Winston

DigiKey sells the chips and a few board-level products.
The chips are by HOLTEK, the boards (using HOLTEK ic's) by MING.
Look under 'integrated circuits, remote control / rf' in the index.

Good luck!

Hej!

Nu ska jag reta folket ordentligt! Jag/Vi lekte lite p&#65533; 29.250 och
det funkade bra till slut. Vi anv&#65533;nde en BBS med forwarding p&#65533; 70cm.
Vi b&#65533;rjade med en Zodiak PR-radio som var flyttad i frekvens.....

Sorry...

Yes we have tried on 10m FM. We used 29.250 and started off with a
11m FM transceiver. This didn't go well. Most of our users didn't
had any NBFM transceivers. So we went for standard FM instead. Bought
a second hand IC-725, installed the FM-option and it worked fine.
This wa using standard AFSK. I think many users dont want to tie up
their handheld on packet since they dont want to wear out the
connectors. Sounds silly but two of my friends has done it! So I
thought we could provide them with 10m FM instead. Unfortunately
our club has to change location in a short time so I chose to go QRT
with our BBS.

OZ3BBS (I think) has regular forwarding on 10m southbound.

Since AFSK requires such a high Signal-to-Noise ratio it would be
better to use either FSK or BPSK. But then you would loose the local
users who liked the 10m port since 2m is terrible congested at some
times. I also know that SK4HC has had a port on 10m but since there
was no or little use of it it was dropped.

I know that I am sticking my nose out but since the number of sun-
spots is increasing, maybe this is something worth considdering.

What do you think?

Best 73's and please feel free to comment.

SM7PAF / Tommy

1663. f6fbb forward protocol

Newsgroup: rec.radio.amateur.digital.misc

That makes sense. It seems like an bovious pattern now that you've
pointed it out. Nice to know that there's some method in the madness.

>As for the 300b, 6146, etc, you're right - no information there.

I think that these numbers may have been assigned sequentially, either
by the military or by the manufacturer. No help for figuring out
anything about the tube, unfortunately.

(Fast Scan) ATV requires a few MHz of bandwidth. It wouldn't
fit in any of the HF ham radio bands. That's why ATV is found
only on UHF and above.

There is another popular way of sending images called Slow Scan TV.
This requires only a couple kHz of bandwidth. Many people still
think of SSTV as an "HF" mode but most of the recent growth has
been on 2 meters.

For more details, see the SSTV FAQ:

1671. DMARC Digital Band Plan

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-19 00:00:00 UTC
From: Stan Staten <3winks@msn.com>
Message-ID: <01bc34b6$98a25940$b36c60cf@sstaten.erols.com>
Source record: 30975

Digital Frequency Plan as accepted at the 3/8/97 DMARC Meeting.

This plan presents Digital activities as we understand them and changes worked out with T-MARC. It is based on the previous plan with the T-MARC changes as indicated.

Thanks to all those who helped. W3LPL for DX Cluster representation, W3EAO for considerable effort on for T-MARC, WA2WDT for carefully considered changes in formulation and finally the DMARC Board, WA3TAI, WA3UMY, KC4ASF, N4LXI and W3INK.

The DMARC area is Deleware, DC, Maryland and Northern Virginia. DMARC will continue to represent those with digital radio interests in a continuing dialogue with T-MARC in the committee that has been formed to continue the process that has worked so far. We look forward to this continued dialogue.

NOTE: Some changes are dependant on positive vote on T-MARC updates vote.

Please see the MARCH AutoCall T-MARC article. If the T-MARC vote produces changes, they will be presented at the next DMARC quarterly meeting for implementation vote.

Signed. Stan, W3INK, Secretary, Digital MidAtlantic Radio Coucil

****

Digital frequency utilization in the TMARC/DMARC area - MARCH 1996

CHANNEL USE GUIDELINES

Note: The secondary use MUST cease upon request of a primary use provider (i.e. the BBS/cluster sysop could demand that an interfering forwarding link cease, but not a BBS user. A specific example is the long standing policy of no AX.25 bulletin forwarding on 2-meters in the evening to provide better user service).

50.610 - 50.760 - Network inter-node linking
50.780 - 6M TCP/IP Node
51.610 - 51.660 - Network inter-node linking
51.680 - Network inter-node linking
51.700 - 51.99 - Network inter-node linking

To ease individual user access to networks BULLETIN forwarding on 2-meters will not be done from 7 pm to 11 pm every evening. As a general rule, forwarding should be done on 219 MHz or higher.

New Frequencies transition period to 144.xxx frequencies ending by
January 1, 1998.

144.31 - 9600 Baud
144.33 - 9600 Baud
144.35 - 9600 Baud
144.37 - 9600 Baud
144.39 - APRS

144.91 - BBS 9600 bps only (user access primary, linking secondary)
144.93 - DX Packet Cluster
144.95 - TCP/IP network 9600 bps (linking primary, user access
secondary)
144.97 - BBS/node 9600 user access (user access only, no linking)
144.99 - DX Packet Cluster

End new frequencies

145.01, .03, .05, .07, .09 - 1200 BBS/Nodes/Forwarding
145.51 - 145.53 - DX Cluster
145.55 - Space downlink (MIR & SAREX) primary; temporary point-to- point
use secondary (NO BBS, mailboxes, digis, nodes, servers, etc.)
145.57 - DX Cluster
145.59 - DX Cluster
145.61 - BBS/Nodes/Forwarding, TCP/IP
145.63 - DX Cluster
145.65 - BBS/Nodes/Forwarding, TCP/IP
145.67 - 1200 User/BBS (No BBS<-->BBS)(no forwarding)
145.69 - 1200 User/BBS (No BBS<-->BBS)(no forwarding) DAREN network (WV)
145.71 - DX Cluster
145.73 - SKYWARN/ARES/RACES AX.25 (See VDEN Guidelines)
145.75 - TCP/IP RACES EOC links (primary), RACES LAN (secondary)
145.77 - Keyboard-to-keyboard use, SEDAN (primary); any secondary use
must be compatible with SEDAN
145.79 - APRS Location (Nationwide)

147.57 - Use of this frequency to end by January 1, 1998

219-220 - Wide-band forwarding links (10 channels)
223.52 - direct keyboard to keyboard operations
223.54 - Network inter-node linking
223.56 - Network inter-node/BBS/user
223.58 - Network inter-node/BBS/user
223.60 - User Access. No BBS forwarding or DXCluster
223.62 - Network inter-node linking
223.64 - Network inter-node linking
223.66 - Network inter-node linking
223.68 - Network inter-node linking
223.70 - DXCluster
223.72 - 223.78 MHz

431.100 - DX Cluster
432.950 - TCP/IP 56 kbps backbone; MD RACES Network

New Frequencies

433.400 - High speed networking
433.425 - High speed networking
433.450 - High speed networking
433.475 - High speed networking

NOTE: Despite longstanding digital use, 440.925 - 441.275 have the potential for ATV interference in selected areas. These problems should be resolved on a case-by-case basis. To ease the potential for interference BULLETIN forwarding in the 441 MHz subband will not be done from 7 pm to 11 pm every evening. This applies only to stations within the defined service area of the coordinated ATV repeaters. For practical purposes, these service areas are the metropolitan areas of Baltimore, Md and Washington, D.C. While it is recognized that not all stations can adopt quiet hours, the new channels at 446 and 433 MHz offer spectrum where stations, especially high power stations, may move to that will not interfere with the ATV interests.

440.925 - 9600 User/BBS/Forwarding
440.950 - 1200 SkyWarn/Public Service (VDEN)
440.975 - 1200 BBS/Forwarding
441.000 - 1200 User/BBS/Forwarding
441.025 - 1200 User/BBS/Forwarding
441.050 - 9600 User/BBS/Forwarding
441.075 - 1200 User/BBS/Forwarding
441.100 - 1200 Keyboard - Keyboard (simplex)
441.125 - 1200 Keyboard - Keyboard WAN
441.150 - 9600 Keyboard - Keyboard (Simplex)
441.175 - 9600 Keyboard - Keyboard WAN
441.200 - 9600 User/BBS/Forwarding
441.225 - TCP/IP
441.250 - 9600 User/BBS/Forwarding
441.275 - User/BBS (No BBS <--> BBS)

DX Cluster transition to these frequencies immediately upon approval of T-MARC update vote

446.025 - DX Cluster
446.050 - DX Cluster
446.075 - 1200 User/BBS/Forwarding

446.200 - TCP/IP
446.500 - Shenandoah Valley WAN
446.225 - DX Cluster
446.100 - High speed MDCVA WAN
446.250 - DX Cluster
446.125 - 9600 User/BBS/Forwarding

Subject: QSL Cards for Packet email
.....
I have been told that we can trade QSL cards for messages transferred
via packet BBS.
I am interested in trying this out, does anyone know what the accepted
procedure is?
.....

Well, of course you can exchange postcards with anyone you like - but the point of calling this a "QSL Card" has always escaped me. QSL is the pro-sign for "I acknowledge receipt of your signal" - but if you're using a packet BBS, the only signal you've detected is the one from the BBS, not the origninating user. You might as well phone up hams in distant areas and send a QSL card for the phone conversation - really, at that point, the QSL becomes an ordinary post card, not an acknoledgement of skill at the radio art.

I'm "restricted" to 6 metres and down, too...but I respect the meaning of the QSL cards too much to think that packet BBS messages, which have been relayed by possibly scores of other stations, or possibly by Internet wormholes, represent any particular increment in skill. It doesn't matter if the station is down the street or in the Antipodes, you're always "59+" on packet.

Enjoy packet messags for their content - once you've figured out the software, the TNC, how to hook up the radio, and getting the antenna into the air, there's no more "skill" involved - a real purist would take down his setup after the first packet contact since there's no more to be learned or demonstrated by a second contact. Luckily for us most hams find other uses for packet seperate from the process.

Most of my packet activity has been carried out by a robot...the process is nearly entirely automatic. I don't expect QSL cards from my local BBS but I still manage to enjoy the *content* of the messages.

I suspect my opinion is in the minority, though.

73,
Bill VE4STW@VE4KV.WPG.MB.CA /* packet, not Internet ! */

It depends on the brand of TNC that you're using. If you're using a Kantronics TNC, then RESET is the proper command. The MFJ TNC's use Restart. I no longer remember what AEA uses, and I'm sure the guys from PACCOM can tell you what they use. If I remember correctly though the Tapr TNC2's used restart also.

> Fred ke8tq

Depends on the TNC.
For Kantronics it is RESET.
For AEA it is RESTART.
(Assuming my memory remembered it correctly. Consult the manual
that came with the TNC, use the TNC "help" command, etc. to verify)

THere is no "MYCALL" in KISS mode ...

>
> Thanks.

Most any Mac communication software will usually work. I use an old SE and the Poor Man's Packet Modem that I built and use the Saviant software with it. I also use a MFJ 1270 with the MFJ packet software with the SE and also with my PowerMac. The cabeling between the tnc and Mac will vary with the tnc used. The MFJ 1270 uses the standared modem cable to interconnect.

Any other questions just let me know, you may want to check into MacNet which is dedicated to the MacHam Radio user.

I have purchased a tapr2 tnc at a hamfest and am having problems (surprise!). It works in digital loopback as well as analog loopback modes. It also has the TAPR DCD mod and version 1.2.6 firmware.

It just wont here any input from the radio. I have monitored the output of the dcd chip xr2211 pin 7 and cant see any difference on the scope.

I would like to get a schematic of this tnc (ver2).Any help would be apreciated.

Thanks,

Source record: 30989

Hi,
I'been hearing MIR's packet station on various passes. Last night, I finally decided to try and connect to them. I was seeing people calling CQ as the station popped into radio view. I connected, but didn't know what to do past that point. Can someone tell me about the proper methods of making contacts via MIR?

I have my unproto command set to CQ VIA R0MIR. I then typed "K" and put my terminal into the converse mode. Is that the right way to do it? DO I simply leave my station in the converse mode and type to others I see on the screen?

Or... should I connect and then in turn try to connect to others from there? This looks like lots of fun, but I don't want to do it the wrong way in haste.

Fast Scan TV is not possible of HF as the bandwidths required for TV (5-6MHz) are much to wide for this band. While there are modern compression techniques which can give (relatively) fast scan over HF, they not in the use on the amateur bands to any real extent.

There is, however, Slow Scan TV (SSTV) which operates on HF. Can't help you with any sked times, though.

1691. Serial PC card for AMTOR/PACTOR

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-21 00:00:00 UTC
From: i3683@csc.dk
Message-ID: <5gtubp$7kq$1@news.uni-c.dk>
Source record: 30995

I want to interface an old NAVTEX (AMTOR/PACTOR) receiver to a PC.
I have a 100 baud syncronous bit stream from the receiver. It flips
between +5V and 0V. It is not FSK modulated.

I imagine a serial adapter card (for a PC) which is Zilog 8530 compatible
would be useful for fetching the signal into the PC.

But these days most serial adapter cards for PCs are only 16550
compatible.

Where do you get a Zilog 8530 card for a PC these days?

Are there other cards or other chips that would be more useful for
receiving AMTOR bitstreams than Z8530 cards/chips?

I suppose if you had a TNC with complete schematics + complete technical
manual you might modify it to do what I wish, if you were familiar with
the CPU family used inside the TNC.

Alternatively you might build a FSK modulator and turn the bit stream
into FSK modulated audio, which an unmodified TNC would accept as input.

But I have more faith in a simpler solution, which I imagine would
include a Z8530 based serial adapter card for a PC.

Regards, Anders

Can you say REPEATER... Try it, it's really easy.

Maybe 10 or 20 years from now some co-ordination group will provide for single band full duplex digital. This means some old fart and his 2 friends might have to give up their 'progress-line' voice repeater, but it COULD happen... maybe..

From the reading I've done on the subject, connecting to other stations is allowed, but generally frowned upon. R0MIR will allow only one station to connect at a time. Trying to call CQ via MIR not only blocks out people who wish to contact MIR, and also creates more interference for those same people.

I beleive there is a FAQ and a couple of web pages that address this issue in more depth.

In your autoexec.nos, somewhere after the attach command for the
interface for your TNC, add this:

param <iface> dtr 1
param <iface> rts 1

Also, check your IP routing.

Turn your trace on, also type "str off" and then telnet.
Watch the screen.
Two things are probably the culprit. #1 you don't have a route.
#2 you don't have an ARP entry. What could be happening is
your system is sending out an ARP, and no one is replying.
In most cases, the problem is poor RF. Check your radio,
check your deviation. Don't assume anything, and don't run
over deviated for years on end.

Since your radio isn't keying up, I suspect you don't have a route,
or your ARP entry for the route is on the wrong port.

Its been my experience that getting a message very far via packet has
got to be one of the most challenging modes of communication that has
ever existed. I'd bet even the Pony Express was faster and more
reliable. A QSL card would likely get back to the sender faster than a
reply via packet would and might be very appropriate considering the
circumstances.

1698. Baycom, AX25.com and JNOS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-21 00:00:00 UTC
From: Rick Ruhl <n4gdo@nadxc.org>
Message-ID: <01bc3648$f226b720$12d881cd@home.cssincorp.com>
Source record: 31002

Hi folks,

I've heard this combination can work, but I cannot seem to get the AX25 driver to work correctly. It does load, JNOS sees it, but when I try to do a connect, it sounds (by listening on a scanner) much slower than the l2 baycom driver.

I've tried this configuration on a 386/20, 486/50 and AMD p5/120 with the same results. The transmiited will key on a connect, but will not connect and the 'sound' of the packet seems much slower than when I'm using the Baycom 1.5 software.

What must I do to make this work? I've even tried reprogamming the 8253 timer chip to see if that would make a difference, but it doesnt.

Thanks

Rick

>
> As for the 300b, 6146, etc, you're right - no information there.
>
> 73, Bill W7TI
> wrt@eskimo.com

4CX1500: 4 = tetrode (four elements)
C = ceramic construction
X = external anode
1500 = CCS plate dissipation

12AU6: 12 = filament voltage class (12.6 V)
AU6 = basing diagram

0A2: 0 = filament voltage class (no filament, this is a gas regulator)
A2 = basing diagram

6146: JEDEC or JAN type, no relation to configuration

2C39: Anybody know, off hand?

KAWIN NEWS #20 - Announcing KaWin 6.49 and BeaconClock 1.04

Three hot new releases this issue, and all are ready for
download from the KaWin Home Page:

http://www.mutadv.com/kawin

BeaconClock is Freeware for DXers who share an interest in
monitoring the NCDXF/IARU beacons! BeaconClock32 has now
been joined by BcnClk16 - BeaconClock for Win3.x systems.
BeaconClock32 version 1.04 includes minor refinements in the
location data for some of the Beacons.

KaWin 6.49 enhancements include:

Support for the US FCC call sign database. Absolutely the
most current database for US calls - updated weekly and
downloadable from the US FCC web site. Use it by itself or
as automatic fills and updates to your CDROM database. Have
your in-depth database and the latest vanity calls too!

Support for the ANALOG command of the new Kpc-3 Plus,
including on screen monitoring and file logging of sampled
analog levels.

The Statistics context has disappeared - but you can bring
it back any time you want.

New right-click, pop-up menu access to the Record Context
and Disconnect Context commands.

Plus, new macros and more enhancements and fixes - all
described in the Squawk64.wri file.

To subscribe to the KaWin News mailing list, send email to
stan@mutadv.com with the word SUBSCRIBE in the subject line,
or use the handy subscription link on the KaWin Home Page.
To be removed from the list, send email to stan@mutadv.com
with the word UNSUBSCRIBE in the subject line and be sure to
include the email address this message was sent to in the
body - I cannot remove you if I don't know your address!

Source record: 30863

Hello everyone!
I am trying to start a mailing list that is just a general ham radio chat group. I don't know if it is working properly yet or not, but if you would like to try to join the list, just send an e-mail message to: ragchew@webguy.mwci.net with the subject and the first line of the message being "subscribe" (without quotes of course..)

There is no one on the list right now, and I am curious to see if it even works yet. Please give it a try. If you get subscribed, send a message to the list and I will get it.

Thanks for your help!

I doubt the Funny Cookie Corporation would care, as long as you keep it under 5 watts (ie, no linear amp). Don't use your callsign on CB, you'd be out of band; might as well make the FCC work harder if they did decide to do something. Just find a channel with light use. Maybe use one of those frequencies intended for remote control aircraft (look at the frequencies assigned to channel numbers, and you'll find a few gaps, that's what they're there for. You'll be less likely to "jam" a regular voice channel then. And have a reasonably clear freq too.

USA's CB band ranges from about 27 MHz to about 27.350 MHz. A channel
every 10 KHz. I doubt you'd be able to hear anything other than tons
of hetrodynes (from thousands of carriers) from USA in Taiwan anyway.

1715. Any high speed packet in Silicon Valley?

Newsgroup: rec.radio.amateur.digital.misc

1718. BSX2 and FT8000

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-23 00:00:00 UTC
From: Mark Pepper <markp@afpsol.co.uk>
Message-ID: <01bc376d$48f65f40$1eec82c1@home>
Source record: 30872

Hi There

I am new to packet and am having a few problems getting going. Maybe someone would be good enough to provide some advise. Maybe someone is using the same combination of kit as me.

I have a Yaesu FT8000 tranceiver and have built the BSX2 TNC with the TCM3105N modem chip. The firmware in the TNC reports the following:

PacComm TNC-200 Packet Controller
AX.25 Level 2 Version 2.0
Features:
KISS
PERSONAL MESSAGE SYSTEM V 3.0
CLOCK CHIP SUPPORT
CWID
Release E1.1.6D4 September 18, 1990 - 32K RAM

I am using WinPack 6.0 to control the TNC.
I am located in Berkshire UK.

The problems are as follows:
1, Occassionally I can see packet data but not always, even though there is traffic heard on the tranceiver and MON is turned on on the TNC.
2, The DCD light is ON normally and only goes off when the squelch opens on the tranceiver (When a signal is present), shouldn't it be the other way around?
3, I don't know what the STATUS LED indicates but once it comes on the TNC seems to pack in, in that it echos commands I type but does not respond to a CTRL C.
4, If I issue a "C G8NLY" command the PTT light occassionally works but not always and not predictably. Sometimes it will never light.
5, If I record output from the TNC (When it works) and play it back to itself later the data sent is decoded OK. So I know that most of the TNC works OK, sometimes?

Help, I've been trying to sort this on and off for about 6 months now.

1724. real, legal, easy ca$h

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-23 00:00:00 UTC
From: ron_c@geocities.com
Message-ID: <333b0e79.440958921@news.alt.net>
Source record: 30878
Cross-posted to: rec.puzzles,rec.pyrotchnics,rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

If this is not of interest to you, please accept my apologies for intruding on your newsgroup and ignore this. If this is a pictures newsgroup I will follow this post up with some tasty pics. I hate spammers as much as the next guy, but we're talking about some very easy money to be made !! If you are still interested (and YOU SHOULD BE)......

-!!!-PLEASE READ THIS VERY IMPORTANT NOTICE- NOW!!!
!!! MAKE MONEY-LEGAL AND EASY WITH YOUR VERY OWN MAILING LIST BUSINESS!!!
THIS IS THE FAIREST, MOST HONEST WAY I KNOW OF TO SHARE THE WEALTH!!

Hello! Would you like to make thousands of dollars,quickly, legally, with NO CATCH? Then keep reading.... Please take a few minutes to read this article, and it just may just change your life. I SWEAR I'M NOT LYING TO YOU, ANDTHIS IS NOT A SCAM! If you're interested, please, keep reading. If you're not, then, again, I apologize for wasting your time.

The following concept of making money with your computer essentially began in the US and has now spread throughout the Western World. It is perhaps unique inasmuch as there's no risk - people from all over the world are currently participating and those that follow the initial concept are earning large amounts of cash.
Read the following carefully and you too could be joining the many thousands of Internet users who are currently earning quite reasonable sums of money with a few hours work using their computers via the Internet!
****
This posting has been appearing for quite some time and has now literally got thousands of people actively involved. No doubt like me, you may have seen it before and become a little confused by the way it's been explained. However, I personally have never believed in a so called "Free lunch" and have always worked hard to support my family. But this idea is so simple involving only a modest $5.00 investment that I simply had to try it. At first, it took me quite a while to figure it out - my first impressions led me to believe that there must be some catch to it. But this isn't so, you only have to look at the various postings to realise this; the thousands of postings that are made all carry different names and addresses. So with so many people involved I became convinced that with this particular program I too could benefit. Although many of the postings have been modified the

basic principal remains the same, in my opinion the only problem has been the way the initial concept has been repeatedly changed.
With this in mind I have set out to explain what I consider to be a clearer version, in the hope there is no doubt in people's minds that it's fully understood. Because believe me, this system does work!
****
Essential Information to Assist Your Success!!

These articles have been modified over and over again, and embody over exaggerated claims of vast earnings. While this cannot be disputed it is essential in order to receive the attention of those who read it to post an article that gives out the right signals to the recipient. I believe this article does just that, it's not full of unnecessary $$$ signs, neither does it contain ridiculous claims which only puts people off. If you want to get started right away, simply amend the address section by removing the top location and place your own name and address at the bottom.
****
In general, these postings lead you to believe you can make $50,000 within a month, which I think is a little over the top.
But now after only a few day's of my initial involvement, I'm beginning to get a reasonable and realistic return with a further understanding of just how big this concept is. The money is coming in from all over the world, and sure comes in useful but what's more important is the fact I have proved this to be a totally workable and legitimate system, involving no risk and no major cash outlay.
My other concern was the legal aspect, so I checked this through and was told that providing I mail one dollar to the person I am asking to put me on their mailing list, I am in fact paying for a service. And that service consists of using the Internet to advertise a business.
So what is this business? Well this business is to do with assembling a mailing list of people who are interested in working from home using their computers to generate an income.
****
Ok...if your interested there are three basic steps: All of which are pretty simple. Think positive, after all, the people below became involved just like you!

Let me tell you how AND WHY this works .. also, MAKE SURE YOU PRINT A COPY OF THIS ARTICLE NOW, so you can get the information off it as you need it.

STEP 1:
Get 5 seperate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." (In this way you are not just sending a dollar bill to someone, you are paying for a legitimate service.) Fold a $1 bill inside each piece of paper with your name and address on it, and mail these 5 letters to the following 5 addresses:

1- SRO Services
PO Box 909
Puunene, HI 96784
USA

2- Aumakua Enterprises
PO Box 277-316
Kihei, HI 96753
USA

3- Ross McCrindle
2-28 Cambridge St. S.,
Lindsay,Ontario
K9V 3B6
Canada

4- Sean Ringle
PO Box 1
Lanesville, IN 47136
USA

5- Ron Campbell
106-1309 West 14th Avenue
Vancouver BC V6H 1R2
Canada

STEP 2:
Now take the #1 name off of the list that you see below, move the other 4 names up. (5 becomes 4, etc.) and add your own name as number 5 on the list.

STEP 3:
Change anything you wish to, but try keep this article as close to original as possible. Now, Post your amended article to at least 200 newsgroups. (there are around 19,000 groups). All you NEED is 200, but remember, the MORE YOU POST , THE MORE MONEY YOU MAKE!!!

You are now in the mailing list business, and should start seeing returns within a week or two. Of course, the more newsgroups you post to, the greater your return will be. If you wish to remain anonymous, you may use a pseudonym, but make sure address is correct.

LEGAL ???

People have thoroughly discussed whether this is really legal. You are using the Internet to advertise your business. What is that business? You are assembling a mailing list of people who are interested in home based computer and online businesses and methods of generating income at home.
REMEMBER - people send you small fee to be added to your list. It is legal. What will you do with your list of thousands of names? That's up to you.

HERE IS WHY THE SYSTEM WORKS:

The internet is growing at a tremendous rate - it doubles in size every 4 months. Think about it. You see those "Make Money Fast" posts more and more. All that growth means potentially big profits for everyone who participates.

Of every 200 posts you make, you should receive roughly 5 responses. That probably doesn't seem like much. You make $5.00 for every 200 posts with your name at #5.

Each person who sent you $1.00 now also makes 200 additional postings with your name at #4. i.e. 1000 postings. On average, 50 people will send you $1.00 with your name at #4. That's $50.00

Your 50 new agents make 200 postings each with your name at #3 or 10,000 postings. Average return 500 people=$500.00. They make 200 postings each with your name at #2=100,000 postings=5000 returns at $1.00 each=$5,000.

Finally, 5,000 people make 200 postings with your name at #1 and you get a return of $50,000 before your name drops off the list. AND THAT'S IF EVERYONE DOWN THE LINE MAKES ONLY 200 POSTINGS! Potential income in one cycle = $50,000.

REMEMBER THIS ---- thousands of people all over the world are joining the internet every day and reading these articles every day just like you are now. So can you afford $5 dollars and see if it really works??? I think so.....

Lets review why you should do this. THE ONLY COST IS $5.00, 5 STAMPS, AND 5 ENVELOPES. Anyone can afford $5.00 for such an effortless investment with such SPECTACULAR RETURNS.

There are millions of internet users, and millions of new net surfers every month. REMEMBER - read the instructions carefully, and play fairly. THAT'S the only way this will work. Get a printout so you can refer back to this article easily.

Keep a list of everyone that sends you money, keep good books, pay your taxes, and always keep an eye on the postings to make sure everyone is playing fairly. You know where your name should be.

If you're really not sure or still think this can't be for real, then don't do it. But please print this article and pass it along to someone you know who really needs the bucks, and see what happens.

REMEMBER - HONESTY IS THE BEST POLICY. WHAT IS $5.00 TO YOU? YOU DON'T NEED TO CHEAT THIS IDEA TO MAKE MONEY!!! This is the easiest way that you can make a buck. Think how excited you'll be to open up your mailbox day after day! Will it be $50.00 or $5,000.00?? Start making your plans, because it can happen to you.

DON'T PASS UP THIS ONCE IN A LIFETIME OPPORTUNITY

> voice channel then. And have a reasonably clear freq too.

This is shockingly bad advice. In the first place, use of packet on CB
is illegal in the US. Now enforcement is lax, so that in itself isn't a
compelling reason not to do it. But to advocate using RC channels is more
than stupid, it could get someone hurt. It would be bad enough if you
only caused a model aircraft to strike someone, but these RC frequencies
are also still used to control industrial equipment. One very old
broadcast tower here uses these frequencies to control its elevator, and
at least one steel fabrication plant uses them to control overhead
cranes. Now the controls are digitally coded, so it is unlikely that
voice usiers could inadvertently make them move, but packet is another
story. The odds of accidental activation are much better. Don't do it.
If you must bootleg, do it on amateur frequencies where you won't kill
someone.

1726. DSP project ideas

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-23 00:00:00 UTC
From: kodis@kodis.jagunet.com
Message-ID: <slrn5jaj78.g0b.kodis@kodis.jagunet.com>
Source record: 30880

Lately I've been considering developing software to decode some type of digital signal from the data stream resulting from feeding a S/W receiver into the sound card on my PC. I was thinking along the lines of a program to decode Morse, RTTY, weather FAX, of some other digital type of signal from an audio source.

Before starting, I thought I should ask about the feasability of such a project. I'd be interested in knowing

= has this has already been done, and if so, is the source available?

= have all these types of projects been analysed and deemed computationally infeasible?

= are the algorithms and techniques for such work well known, or a difficult research project?

= what type of decoding program would be the simplest to develop, and the most likely to work well enough to be useful? Is there any other type of decoding program that would be easier/more useful/ more likely to work/more interesting to program, or whatever, that I should consider writing instead?

Also, I wondered if anyone is familiar with the book "DSP Techniques in C". Would this be a good starting place, or is there a better book to start with?

Sorry for asking so many questions, but I'm just getting started here. I look forward to whatever insights this group has to offer.

-- John Kodis.

1727. PK-232 help needed

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-23 00:00:00 UTC
From: James Chance <jchance@min.net>
Message-ID: <33355D5F.4C41@min.net>
Source record: 30881

I have an old PK-232 (EEPROM labels show a 1987 date) I recently picked up. No manual, naturally <g>. Anyway, it appears to initialize, TUNE leds show activity when I tune into a signal, MODE leds seem to match the received signal (i.e., if I power up the TNC while listening to a VHF packet signal, the PKT led will light, if I'm on the HF rig listening to a CW qso, the MORSE LED will light, etc.). None of the software I've tried will recognize there's a TNC connected though. The PKGold testdrive will cycle the LEDs when it tries to initialize, but after running through quite a few attempts, it dumps saying there's no TNC present. The cable is good, the port hardware in the computer is good (my BAYPAC runs fine)....

Anyone have a manual for a PK-232 I can buy (or photocopy and return), or any idea if one of the 7 or 8 jumpers inside might be causing this? Or any ideas at all <g>?

1728. Re: BSX2 and FT8000

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-23 00:00:00 UTC
From: Mark Pepper <markp@afpsol.co.uk>
Message-ID: <01bc37b4$632d85e0$1eec82c1@home>
Source record: 30882

Roger

Thanks for the suggestions. Where do I know your call sign from? WinPack?

Since I wrote the article below I have done some more testing and playing. I think the reason the DCD light is on all the time is because I tied the Squelch out from the FT8000 to the squelch in on the TNC. On re-reading the documentation (8 sheets of A4 stapled together) again this is probably not what should be done unless you are using a number of TNCs connected together. Does this sound right? Anyway, with this disconnected I get the TNC transmitting more often (and when there is no other user on the air! I have been testing on a free / silent frequency where possible).

Another observation I have made is that now with the above mod the DCD light never lights. Well it did when I first made the mod and I was transmitting but it does not light when another station transmitts. Am I correct in expecting it to? Data is displayed on the terminal at this point but the DCD LED definately does not light now.

When I listen to the transmitted output on a separate receiver the tones sound about right but are of very short duration, maybe 3-4 secs only. I get no reply from G8NLY either. Should I?

I have tried simple terminal progs including a terminal (USR Pilot running terminal software) and get the same lack of connection.

The TCM3105 is used on a little sub board that plugs into the AM7910 socket. The mod is as described in the documentation supplied with the BSX2 PCB by G0BSX (issue5). I cannot find an AM7910 to use. Is anyone out there feeling in a generous donation mood?

Something else I've been reading about today is this DCD state machine. At the moment the FT8000 is doing the squelching or I am just leaving the squelch off. There seems to be some small mod I can do that uses the state machine to detect the signal and produce a DCD. Do I leave the squelch off? ON? or off and implement the state machine DCD?

What does the STATUS LED indicate?

Thanks for the help so far.

TAPR still sells the TNC-1 KISS and WA8DED Host mode eproms, and the
TNC-1 source code is freely available for download from ftp.tapr.org.
That sounds like support to me.

Thank you. I was aware of the DED firmware (I was around when Ron first wrote and distributed them -- had the DED terminal in the TNC within two weeks of the release). I was not aware that TAPR was supporting the TNC-1 with KISS mode. I was told that I could get the EPROM for the original terminal host, but I already have that along with source. I was looking for KISS source.

My comment as to support was that TAPR no longer supplies the kits, parts or development support, which is to be expected after all these years.

That's Tiny-2 firmware, much used in BSX2s.

>I am using WinPack 6.0 to control the TNC.

Dump the WinPack for now and take the following steps:=

1. Get the TNC working in DOS (that's "raw" DOS, not a DOS box in
Windows) using a simple terminal program such as an old DOS version of
Procomm.

2. Get the TNC working in Windows using Windows Terminal.

3. It will then work with WinPack.

>The problems are as follows:
>2, The DCD light is ON normally and only goes off when the squelch opens on
>the tranceiver (When a signal is present), shouldn't it be the other way
>around?

That is definitely upside down! You've done something wrong in your TNC
construction.

>4, If I issue a "C G8NLY" command the PTT light occassionally works but not
>always and not predictably. Sometimes it will never light.

The PTT won't/shouldn't operate whilst DCD is on. Seeing as your DCD
works backwards, the only time your TNC will tx is when someone else is
tx'ing - not the way to become popular! :-)

>Help, I've been trying to sort this on and off for about 6 months now.

I think you need someone to look at the TNC and find what you have done
wrong.

XPWIN supports the KAM and KAM-Plus Controllers. It also
supports AEA, SCS/PTC and HAL P38, PCI4K and DSP-4100 controllers.
Runs under Win 3.1, 3.11, 95 and NT(P38 and PCI4K not supported under
NT).

Check out KaWin. Expressly written for Kam TNC's
and runs fine in bothWorkgroups and Win95.

Info follows:

KAWIN NEWS #20 - Announcing KaWin 6.49 and BeaconClock 1.04

Three hot new releases this issue, and all are ready for
download from the KaWin Home Page:

http://www.mutadv.com/kawin

BeaconClock is Freeware for DXers who share an interest in
monitoring the NCDXF/IARU beacons! BeaconClock32 has now
been joined by BcnClk16 - BeaconClock for Win3.x systems.
BeaconClock32 version 1.04 includes minor refinements in the
location data for some of the Beacons.

KaWin 6.49 enhancements include:

Support for the US FCC call sign database. Absolutely the
most current database for US calls - updated weekly and
downloadable from the US FCC web site. Use it by itself or
as automatic fills and updates to your CDROM database. Have
your in-depth database and the latest vanity calls too!

Support for the ANALOG command of the new Kpc-3 Plus,
including on screen monitoring and file logging of sampled
analog levels.

The Statistics context has disappeared - but you can bring
it back any time you want.

New right-click, pop-up menu access to the Record Context
and Disconnect Context commands.

Plus, new macros and more enhancements and fixes - all
described in the Squawk64.wri file.

To subscribe to the KaWin News mailing list, send email to
stan@mutadv.com with the word SUBSCRIBE in the subject line,
or use the handy subscription link on the KaWin Home Page.
To be removed from the list, send email to stan@mutadv.com

with the word UNSUBSCRIBE in the subject line and be sure to
include the email address this message was sent to in the
body - I cannot remove you if I don't know your address!

I have one and would not trade it. It is easiest to use with frequency agile transmitters as stock it wants to be used on specific frequencies. You can use it with rock radios by changing the primary oscillator frequency.

I'm having trouble with dropped inbound characters from my local packet cluster station. I've tried every setting I can find in the 232's manual, but must be missing something. Can someone help me with the flow control settings at both ends (the TNC and, for example, the Windows Terminal program)?

Thanks.

YOU DON'T NEED TO BE A SCOUT OR LEADER TO EARN THE ScoutElmer AWARD!!!
ScoutElmer Award for helping Scouts become ham ops

WHO QUALIFIES FOR THE AWARD?
1. Licensed ham op (any level)
2. Scout or Adult Leader (past or present) or...
3. Any ham that know someone (Scout or leader) currently active in a Scout unit.

WHAT IS REQUIRED FOR THE AWARD?
1. Agree to respond to Scouts via email with their questions about ham radio in your local area, for 1 month.

HOW DO I SIGN-UP FOR THE AWARD?
Email to the address below and fill in the blanks.... that's it!
1. Name & Ham Call Sign:

2. Email address:

3. Locations: (ie London, UK; Los Angeles, CA, USA; etc)

4. What do you want to do: (email only; email & phone; email, phone & ham class)

5. Your Scout affiliation & position (enter past affiliation and date if applies):
(If no current or past affiliation) Your Scout or Scout leader sponsor:

6. Optional comments for your ScoutElmer listing: (ie. ARC Club listing, Explorer post, Troop etc.)

WHAT DO I GET?
ScoutElmer Award recipients will receive special award logo graphic you can add to your website. You also get a certificate (suitable for framing).
Lastly the satisfaction that you helped promote amateur radio in Scouting.

If you've already applied for the award, sorry for the email. You should receive confirmation in the next few days.

>
>Anyone have a manual for a PK-232 I can buy (or photocopy and return),
>or any idea if one of the 7 or 8 jumpers inside might be causing this?
>Or any ideas at all <g>?

If you're trying to use a standard something to 25pin modem lead, you
may come unstuck, as the PK-232 has a non-standard serial port. Some of
the lines are allocated to drive a Centronics printer (can't remember
what for), but it could well be that something here is preventing a
handshake.

I have access to an old PK-232, but not in my shack, and not for a few
weeks. If you're really stuck I'll beep it through, and post the
pinouts.

One thing bad about the 200LX is that if you run the serial ports with
the 2 AA batteries, they will fully dis-charge in about 15 minutes. If you
don't run the serial port, you can get about 20 hours out of 2 ni-cads.

There are a few programs out there that decode all the modes you mentioned.

Here is what I would like to see - some software that decodes SW Utility stations. Some stations user SITOR, and a few RTTY, but I want software that will emulate a HOKA decoder or a Universal decoder. See http://www.leonardo.net/berri/wun/ for a ton of information on utility monitoring. A HOKA decoder with alot of software costs alot of money, more than $1000.

I also believe you would be a hero if you could make it decode VHF stuff, like ACARS, and the different systems used for pagers.

1752. PC Packet Radio cards

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-25 00:00:00 UTC
From: i3683@csc.dk
Message-ID: <5h82qi$10p$1@news.uni-c.dk>
Source record: 30906

According to the Linux documentation, radio amateurs commonly use
PC cards with Z8530 serial ports for packet radio.

The documentation mentions fllowing cards as being popular:

Gracilis Packettwin
Ottawa PI card
BayCom USCC
Primus-PC (DG9BL)
DRSI PC100 SCC
Eagle Card
PA0HZP SCC CArd

But where are these cards marketed?

Or in case it is build-it-yourself cards, where is the building
description?

1754. Any comments on RITTY 2.0?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-25 00:00:00 UTC
From: Bob Rushby <rushby@sprynet.com>
Message-ID: <01bc3922$31c81a00$5c84aec7@bob-s-toshiba>
Source record: 30908

I just spent the weekend trying out the demo version of RiTTY2.0 and the demo is *wonderful*! It could copy many signals on RTTY and Pactor that my old TNCs couldn't.

However, the demo is limited --some signal processing features are disabled, it shuts down after a few minutes, and transmission is disabled. That's fair, because the author deserves to get paid for what seems to be a fine product. What I would like is some comments from users of the full, licensed, version before I send in my registration fee. For example, is it as good for two-way QSOs as it seems to be for receiving? How much improvement does the full version make on receiving?

thanks in advance,

Bob Rushby VE3GLA

You don't really need up/down control with 9600 baud operation, it is
sufficient to use open-loop doppler tracking (the computer controls the
frequency of the transceiver using its remote control feature, in this
case CI-V)

Yes, and possibly cost some R/C modeller hundreds of dollars
and hundreds of hours of work if you cause his aircraft to crash.
Please don't do this. As long as you stay off channel 9 on CB, you
won't hurt anyone, just annoy them. Interfering with R/C airplanes
can be dangerous, imagine one of the new turbine powered models (20+
pounds) hitting a car at 100+ mph, or a helicopter drifting into a
group of onlookers...

If I remember correctly, the PK-232 has a battery which holds the memory
including the baud rate setting. Most dedicated terminal programs
require you to remove the battery so that the auto baud rate sensing in
the PK-232 will detect the correct terminal baud rate.

<packet cards>

I know nothing about packet or dig radio but am curious about trying it.

What are the ups and downs of having the TNC as a card inside a computer
vs and outboard TNC?

We have compiled in a database 1000 names of record company executives, A&R reps, TV and film music supervisors, their addresses, phone and individual fax #s. It is extremely accurate and well done, ready to drop the name into your cover letter or just to use to make inquiry calls. All syles of music are accepted by over 300 record companies. A&R reps are listed by their particular genre. For more information (it'll be worth it), email at We R Many@aol.com, or call 213/860-6597.

Dave,

You shpuld ask sears if they have a schematic for a garage door opener
. Those are the best transmitters. If you have the time you could make
millions of channels, although that would probaly kind of pricey(?).
If you want more info e me.

Our bands are being threatened, antenna, and RF-power, restrictions are being considered. If you have something to say that will further ham radio interests, you can quickly and easily e-mail your representatives on these issues. at

http://www.sarrio.com

I offer a complete list of Senatorial and Congressional e-mail links to all members of Congress that receive e-mail. Follow the Political Action links on either my graphic or text only home pages to the Congressional E-mail Link.

I would suggest,however,that if you e-mail Congress, that you limit your e-mails to only your own district representative or state senator. Include your name and address, this will inform your representative that you are one of his/her constituent and he/she will be far more likely to seriously consider your letter. Also try to be civil and informative in your message, remember we need their support.

In article <33384E79.3E1E@staffnet.com>, Bob Lewis <rlewis@staffnet.com>
writes
>If I remember correctly, the PK-232 has a battery which holds the memory
>including the baud rate setting. Most dedicated terminal programs
>require you to remove the battery so that the auto baud rate sensing in
>the PK-232 will detect the correct terminal baud rate.

Indeed, it does. The PK-232 (not sure about the MBX version) has a 3 AA
cell nest attached to the lid of the device. Remove the screws from the
case, and you can easily remove the batteries. Be careful not to pull
the wires off when you remove the lid - the PK-232 that I've used
recently doesn't have a great deal of slack in the wires to the nest.

Having said all that, I wouldn't try to get things going with an
'intelligent' terminal program first. Try something simple like Windows
Terminal, or Win95 Hyperterminal, and see if you can autobaud the beast.
The official procedure is to send a *, and it should autobaud - if this
doesn't work, send another *. I find that sending six * characters, then
a CR gives you the sign on message.

From memory, the highest baud rate supported by a PK-232 is 9600 baud -
19200 or higher just won't work. Set your terminal parameters to 8-N-1,
as well, IIRC. Although it isn't a particularly good multimode program,
paKet 6 has a good help file for the 232.

Have we got you going yet?

1766. kpc-3 and software squelch "cd"

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-26 00:00:00 UTC
From: wright@onramp.net
Message-ID: <wright-2603970649470001@jbw.csbsdal.org>
Source record: 30920

i have been using my kpc-3 set to "cd software" squelch for about 18
months as a packet bbs. all of a sudden, it seems not to be working quite
right.

symptoms:
-full scale and steady recv of the incoming signal (as seen on kenwood 241)
-data light flashes, does not show a steady stream of data
-failure to connect to this other station

when i change the cd to software, and set the squelch on the radio, the
tnc works fine.

i seem to be having this problem with just one packet node. i can set the
tnc to cd software and connect to other bbs's without problem.

is this a tnc problem, or a problem with the other station?

thanks and 73

jeff kc5nez

1767. The Personal Electronic Picture Album

Newsgroup: rec.radio.amateur.digital.misc

Personal Electronic Picture Album

Share your Pictures with all your Family and Friends without making duplicates
for one low price!

Download a sample program: http://members.aol.com/lacyent/lacyent.html

Lets look at an example of how pictures are currently shared. You have a birthday party for your three year old and some of the relatives can't attend. So you take a roll of 36 pictures
during the course of the party. You get the pictures developed for $5.79 and now want to send some of the pictures to grandparents, aunts & uncles and the brother in college. You choose the 10pictures you want to share copies of, spend a total of $60.00, to make duplicates for 6 copies of the 10 pictures. So far you have spent a total of $65.79. A couple
of weeks later you are talking with a friend who lives in another state and they ask for a few
pictures, so you spend money to make more copies and send them off.
BOY, what a Hassle and Expense.

With the Personal Electronic Picture Album, you send in 10 pictures of your choosing, and we
send you back a program that displays the 10 pictures. (We also send back the pictures) You can now send the Electronic Picture Album to anyone you want. What would you say if I told you that you could send those pictures to anyone you want for only $14.95? YES, that's right,
for only $14.95 you can send your 10 favorite pictures from your child's birthday party, Christmas, the recital, or any occasion you want. Just think, if you sent the 10 pictures in a
Personal Electronic Picture Album to the same 6 people above instead of making duplicates , you would save $50.00 and be able to send the pictures to all of the people you want.

Want to see an example of the Personal Electronic Picture Program at no charge? Then all you have to do is download the file now. Goto http://members.aol.com/lacyent/lacyent.html

We will send the Personal Electronic Picture Album via E-Mail and return your pictures via regular mail.

Picture Albums with 10, 15 or 20 pictures are available. Visit our Web site for complete ordering info, price lists and to download a sample program. Mention discount # 12559 and take a 10% discount on your order.

Another tactic, is to get the commercial
satellites to carry Ham radio Spread Spectrum for
free. Sort of like the TV broadcasters allowing
us to use their towers.

Don't worry about others using and sharing our bands.
There's about 300 Million Americans, and an average of
23 active Hams per county in America. It doesn't take a
rocket scientist to figure out that we are the second last
socialist cause in America (behind sugar subsidies).

On fri.march 1997 I agree to trade a toshiba laptop for a htx-202 mint and we agree to
ship in the same time.I also offer him to fax the shipping and insurance receip but he
decline saying he does not have access to a fax.Yesterday because there was long time,I
wrote and ask for shipping proof,he told-me he just receive the radio it was return
because the address was wrong(I was not born yesterday).So i re email and tell-him
he never have send the radio and he reply and agree of yes he did not ship the radio yet
he tought check the laptop before sending the radio(very sport from him he want me to
trust him but he won't trust me).I decide to ask him to return the laptop because he did
not respect his part of the deal but he do not want to return the laptop he told will
ship the radio as we first agree(he see things his way).SO will have to take his mint
radio(what do you think it will be?)
I have to live for 12 days and untill this moment I have not receive any confirmation
of shipping from but when I will be back I will update you on that and also will find
a sponcer for a weeb page with BAD TRADERS.

>vs and outboard TNC?

There is very little difference in having the TNC outboard or inboard on a card. In both cases it is still a TNC (an outdated paradigm), and will behave the same way, IE the only inboard TNC of which I am aware looks like a TNC connected to a comm port to the PC, so it is no different than having a real comm port talk to an external TNC.

What you really want is a digital interface board inside the computer which does direct DMA to system memory, and which connects to an external modem. This is what the Gracilis Packettwin and the Ottawa PI2 cards do. This lets you use a high performance external modem while tightly coupling data to the PC where the protocol details are handled in system software.

TNCs were designed in the days of dumb terminals, IE *Terminal* Node Controller. That day is long past. What we need today is a way to get data rapidly in and out of our computer systems in order to service high speed modems. The Z80 in a TNC is a bottleneck to doing that, as is the use of a comm port. The native PC processor can easily handle protocol issues, and DMA solves the comm port bottleneck. (The bottleneck is the result of interrupt per character architecture. The DMA cards generate an interrupt per frame instead. That's much more efficient.)

The Ottawa PI card... http://hydra.carleton.ca
The BAYCOM card is German, would have to check around here to see if I
still have the address. The one I had (stolen with PC) I bought from
Siskin Electronics in the UK.
PA0HZP likewise, I bought mine from G1PLT. I'm just testing it on
loopback at the moment till I get some time to fix up my coaxes and
that's likely to be some time in May.
Hopefully your post will smoke out someone with better information.
Also nic.switch.ch is another good site to check.

SSTV and WEFAX have, both in DOS and Windows. The only PD source
I'm aware of is for an FFT-based Morse decoder, called FFTMORSE. It's
available on Simtel. (DOS program in C)
>
> = have all these types of projects been analysed and deemed
> computationally infeasible?

Analysed yes, 'computationally infeasible' would depend on your definition
of a computer. ;-) (couldn't resist) All are feasible on a lower-end
Pentium.

> = are the algorithms and techniques for such work well known, or a
> difficult research project?

Not to be smart, but both. A simple zero-crossing detector will work, and
is
easy to implement. A correctly designed baseband quadrature detector
will work better, but requires knowledge of both the algorithms and the
environment.

> = what type of decoding program would be the simplest to develop,

Simplest ? Probably RTTY. I don't have any comment on the rest.

>

I stand corrected, but I had thought the RC model people had long since
abandoned the 27MHz CB band channels. Because of too much bleed-over
from congested CB voice channels, and sloppy illegal linear amps trashing
the channels. If this is not the case, it may be prudent to use a CB
voice channel 20 or more KHz away from an RC channel, to avoid adjacent
channel interference to the RC-ers.

Source record: 30935

Hi,
I want to get on packet and I just aquired a Heath HW-202
2 meter transceiver. What I need are crystals to use the
rig on 144.91 MHz and a TNC.

Or can anybody suggest a cheap place to get the crystals?

Thanks for all help.

73,

Tom, kv2x

1784. Baycom at 9600 baud?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-27 00:00:00 UTC
From: tswisher@freenet.columbus.oh.us
Message-ID: <5hetuj$l9b@login.freenet.columbus.oh.us>
Source record: 30938

All;

While looking at Baycom to use on my laptop, I noticed that it was originally designed (and will still) work with a 1200 baud telephone modem. Question is, will it also work with a 9600 baud telephone modem? I just picked up a really nice Motorola 9600 baud modem in working condition for $1 and would like to give it a try on 9600 baud packet with Baycom if possible.

Thanks!

Digi Key has chip sets made by a company called Holetec (sp).
I have used them before. Very much like the chips in garage door
circuits etc...

It is also illegal in Canada. CB (or General Radio Service as it is
officially called here) was originally established as a short range,
line of sight service for small business use. Despite it's popularity
as a personal form of hobby communication it retains that staus in
law. The only modes allowed on CB are AM and SSB. Nor are phone
patches allowed although you sometimes hear them in use.

If you get the abaud to work and get a stream of ascii figures that
look like a smiley face, your unit is probably stuck in host mode.
That results from using it with PC Pakratt I or II. To get out of host
mode, send 3 ctrl-c keystrokes. Good Luck... Jman

1796. Win95 TCP/IP via TNC help needed

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-28 00:00:00 UTC
From: "Markus A. Mueller" <mamueller@access.ch>
Message-ID: <333C26BC.43AA@access.ch>
Source record: 30950

I am currently upgrading my station to get my Windows 95 to send TCP/IP via my TNC. To do so, I ordered the newest WA8DED TF firmware which includes SLIP support for my Symec TNC2H, and added SLIP and scripting support to my Windows 95 system (both are included on the regular Windows 95 CD). But now I am stuck with a serious problem: how can I configure a SLIP connection in a way that Windows 95 will not try to send AT commands to the TNC? There seems to be no obvious way to do so. What I tried:

- Configuring no or a dummy phone number in the SLIP. However Windows 95 will ask for a number is left completely blank, and AT commands are still being sent, including dial commands.

- Installing a "direct connection" / dummy modem when configuring the SLIP connection. However, unlike SmartTerm, SLIP asks for a real modem.

- Adding a dummy modem to my system. Unfortunately the standard modem list provided with Windows 95 does not include such a thing. I guess I have to write my own .INF file for this; unfortunately I am not familiar with the syntax.

Has anybody already done this? I know I could use Trumpet WinSock instead, but if anyhow possible I prefer using a standard solution.

1797. PicoPacket and Kenwood Tm-733A

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-28 00:00:00 UTC
From: "Ted K. Fryberger" <tkfsys@connext.net>
Message-ID: <333C7FF8.6371@connext.net>
Source record: 30951

I recently got a PacComm PicoPacket which I have not been able to get working with my Kenwood TM-733A (or for that matter with my Kenwood TH-79A with a different radio data cable).

The Pico talks to the computer just fine. I can't key either the 733 or the 79 in transmit mode. Both radio data cables are wired per PacComm's and Kenwood's datasheets. In receive mode, no LED's light up, and no messages are displayed on the computer monitor.

The pico has been sent back to paccomm twice. They say it works fine with their radio and cables. I also returned my cable to test - but they lost it.

Am I missing something here ? Is there some other step required by the 733 ?

1798. PK-88 Problems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-28 00:00:00 UTC
From: "John S. Washington II - KB1ATF" <jwashing@gwi.net>
Message-ID: <333C865B.7E8D@gwi.net>
Source record: 30952

I have an AEA PK-88 that I cannot get working. It powers up and the "mult" and "pwr" LED's come on but that is it. It won't initialize or give me any kind of opening screen as it should. One thing I noticed in trying to trouble shoot it is that the 7805 voltage regulator gets extremely hot indicating an overload somewhere in the TNC. The specs say that it should draw 500mA but this thing is pulling close to an Amp. No other components seem to be over-heating and there is no sign of a physical short.

Has anybody run in to this problem before? If so, or if you think you can help me please post any ideas and also cc to my e-mail address as I am unable to frequently check the newsgroups.

Thanks-

John S. Washington II - KB1ATF

I am a general class ham but have been out of the hobby many yrs.

I've never dabbled in digital radio but it interests me and I am giving thought to trying it. However, it must provide me with the same avenue to *communicate with people with as many diff subjects, interests, etc as exists on the Net. IOW... I *LIKE to talk to people about travel, hobbies, useful info.

Some of my favorite newsgroups are frugal living, travel tips, consumer issues, AutoCad info, electronics, etc Can amateur dig radio provide similar stuff? IOW.. is packet and the HF dig modes more like one-to one email or are they like newsgroups in that topics are discussed by many people around the world?

What forms of dig radio would give me access to the most users with similar interests... packet or te HF modes?

RITTY 1.0 ran neck and neck with my ST-8000 on RTTY, which is a high
compliment. So far, RITTY 2.0 seems even better. It's an outstanding
piece of work, IMHO. About the only thing missing is a save buffer, and
I'm sure Brian will implement that at some point.

Hello

I have a plan to buy a TNC and I'm using a Mac (PowerMac 7200/120) and
Newton M.P.120. I have some question hope you can help me.

1.I'm looking at AEA PK-88 or AEA PK-12, which one is better?
2.Can I use it with my Mac or Newton?
3.Does it require specific software or just a VT100 emulator?

P.S. I have used Baycomm for PC (I made the hardwre myself) for 2 years.

OH! the last question. Is there any software (and hardware) just like
Baycomm but for a Mac or Newton?

Source record: 30760

Hi John:

Packet is a lot of fun. You can talk around the world for $50 on VHF!

It has been my experience with regular modems and tnc's, that a couple
of important considerations come to mind.

1) PCMCIA cards tend to get VERY warm in a notebook or laptop. This
will probably shorten the useful life of a modem or tnc.

2) External modems and tncs have blinking lights to show what's going
on with your system or the net communications you establish. With the
internal type you can't always be sure when you're connected or
disconnected.

Soap box retracted ;-)

1805. Re: PK-88 Problems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-03-29 00:00:00 UTC
From: Ron Gibson <rgibson@ican.net>
Message-ID: <01bc3c3f$184ae920$b9b0f8ce@rgibson.ican.net>
Source record: 30762

John.
I had a PK-88 that would to the same thing. There are two possibilities.
1) The internal memory is full (probably not the case)
2) The PK-88 is VERY voltage sensitive. I found that it required a steady 12+ volts to function. As soon as the voltage drops below 11.5 - 11.6 it will go into the condition you described. One possibility is that it suffered a voltage drop when your rig keyed up.

As for the high current, mine would draw just over half an amp. I sure did get hot. Makes a great coffee warmer ;)

>BPQ,
>
>Any ideas ??
>
>Cheers
>
>Stu (G7LHL)
>
Hi Stu,

To run a straight ethernet link with BPQ but not windows, the batch file to start it would be somehting like:

LSL <- link layer
3c5x9 <- card specific odi driver
ipxodi<- err cant remember!
odidrv 125 <-bpq odi driver with int. no.
bpqcode <- switch
term4 1 <-or whatever terminal

Under Win95 it would be (below setup, has win95 odi layer, so all other network protocol's (eg TCP/IP) wil;l work simutainiously):

lsl
3c5x9
ipxodi
odihlp.exe <-windows file, i thk in \windows dir
odidrv 125
bpqcode

In the network section of win95, click on add, select adapter, then check 'exsisting ODI driver'. This will allow all network protocol's to work together, otherwise it would fall over.

Dont forget to have the approiate bpq file (.386 .dll) in the windows directory.

If you need more info e-mail me. cheers.

Digital HF amateur radio will do none of what you are
experiencing in the various channels of the internet
you are pursuing! It is an entirely different medium,
and a different purpose for those in it just now.

Not even sure what some would call amateur radios
purpose just now; other than, for most of us, it
is a life long interest, and an endless way of having
fun!! Occasionaly, something useful is done,
such as my relaying a lot of traffic from Kauai
after hurricane Iniki out here a few years ago eliminated
ALL commercial communication means for a couple
of weeks. That was exciting, as I had a generator,
and was able to get some sort of antenna going
on 20 meters. But that was, I am sure a once in
a life time experience. Otherwise, I enjoy it as
a hobby (that is to have fun).

>ax.25: KB0OLD@KA0GZN.#SECO.CO.USA.NOAM
Depends on the BRAND of TNC, John. Kantronics use 'RESET' while MFJ's
and some others (not sure WHICH) use 'RESTART'.

My advice? Try 'em both, and use the one that works (grin). You
can't hurt anything by using the wrong command...nothing will happen.

I don't know if this is what you're trying to achieve but there may be
another, totally different, way of skinning the same cat.
Have you thought about using Netscape as a packet radio user shell
within Windows and using the contents of a file called ethrax25.zip to
provide an ethernet look-alike connection to win3xx or win95.. It
requires a minimum compilation of JNOS to run the TCP/IP level
protocols and fools windows into thinking its connected to an ethernet
card when, in fact it is connected to an TNC in KISS mode. Haven't
done it yet myself but have actually seen it working a few times.
Steve Hudson, VK4VH in Rockhampton, Queensland, Australia has been
using it and that's where I first saw it. Other than that, try running
Linux using the UNIX version of Windows called X windows. Linux (UNIX)
has, as it's native protocol, TCP/IP with lots of ham radio utilities
including packet radio stuff. Its also a true Multi-tasking,

Multi-user (being a variant of UNIX, of course) operating system
which, in many ways, leaves DOS and Windoze for dead though it does
take some learning and reading..... It'll keep you off the
streets for a while..... You may need to get a divorce first though.
After you've finished playing with it and if your XYL still thinks
you're reasonably sane, you can go away and have a nice romantic
reunion. Have a good shower and a meal BEFORE you start on that stuff,
it'll be the last you'll bother to have time to do for a few
months..... It kinda sucks you into it. Excellent cerebral
escapism!!!!

Hey! Please let's know how you get on. I might be able to suggest
other things as they come to mind....
I dunno where you can readily get a copy of ethrax25.zip but it is,
among ham circles, as common as dirt and a Yahoo or Archie search on
the 'net would readily find it for you.

Best 73's de Bob.

Hi David,

As I recall, it's just an EPROM change, and very reasonably priced. Order the EPROM direct from Kantronics or from your favorite Kantronics dealer. Whoops! I just noticed your email address - last I heard, Kantronics will not fill direct orders for firmware EPROMs outside the US, but many of their dealers will. 73,

Stan

Our local BBS has 9600pbs user port, using Kenwood 440 rig and pac-com TNC. Since the Kenwood & Tnc are loaners, I've been preparing a Motorola Mitrek for packet use at 9600 (by removing the active splatter filter). Our backbone guys are moving to 56kb, so a bunch of the Tekk 19.2 rigs will be come surplus, and considering using one. But, they are low power. I've never seen one, or used one. Is the motorola rig capable of 19.2, or is there something magical about the Tekk radio?? Would using outboard amplifier nullify the bandwidth required by Tekk rigs??

Hello all,
I have a Yaesu FT-2500M for sale.
About 7 months old,low hours,great condition,alpha display,mil-spec.
construction,5-25-50 watt output,31 memories,built in tone
encoder,extended receive,mod has been done for extended transmit.

I have box,packing,bracket,wiring,manual,etc.

Asking $200 and I pay shipping.

Also have an Allmax eprom programmer.

Used 1 time.I paid $650 for it and will negotiate price.

I also have an MFJ 949E tuner for 1.5-30MhZ.

I transmitted once with it.No box or manual but it's in excellent
condition.

Asking $100 or best offer.

Also have an Astatic Night Eagle microphone,never used.I never even put
a plug on the cable.No box,have manual.A little dust but looks
beautiful.

Asking $90.

If interested in anything e-mail me at larry666@gdi.net

73,
Larry Ke4rur

This is correct for new and not so new modems. However, if you can get hold
of an _OLD_ modem which is asynchronous/1200baud, then, with the addition
of a ptt relay you have a perfect modem for packet.

For 1200 baud: CCITT standard V-23
For 300 baud: CCITT standard V-21

You also have to switch the data lines to the signalling lines.
This is called a baycom modem, and you must use baycom or - for other
programmes - use the driver TFPCX.

Dr. Bjorn/LA9FHA - who has never used anything but modems for packet.

Hi Dave,

The upgrade should be available trough any Kantronics dealer. Just
follow the instructions. It involves pulling the EProm that is in the
KAM and replacgin it with the new one. Then run the upgrade for
Hostmast if you use it.

Jeffrey,
I think you are a bit off with this statement.
I run the HP for weeks at a time without having to change the batteries.
(an hour here two there..)
As far as the serial port, I have NEVER seen the batteries drained in 15 min.
What batteries are you using.
Us up here are utilizing the Hicapacity 850ma Radio Shack batteries.
We have found that those batteries can go at LEAST 4-5 hours running baycom or
some other program that utilizes the serial port.

I think that you might have meant the PCMCIA port.
That (esp. with a modem) is a power monster.

Just my .02 cents.

I have a friend without newsgroup access that has a PK-900 he suspects
may have gotten a lightning hit. It doesn't communicate any longer.
A hardware reset will not bring it back to life.

Is there anyone out there that fixes these boxes now that AEA has gone
away?

Thanks,
Jim.

If you could copy him, I'd appreciate it. He is wb4znh@voyager.net.

Has anyone gotten a FT1000D to work successfully with a DSP2232? I get audio and PTT to work, but the tones from the monitor don't warble like they should for RTTY... same happens for PACTOR/AMTOR... I have tried rewiring the DIN connectors, but to no avail.

Maybe I just should give up on the back panel entries and wire an 8 pin mic connector?

Advice thanks

Concerning Mac and Packet....

I have used both MacPlus and PowerPC with packet. No sweat. I have used Virtuoso, but found it cumbersome. MacRatt was a bit doggy, sorry! I generally use a generic terminal program. Z-term (widely available shareware on internet) works fine. But, I now use WhiteKnight. Its predecessor, RedRyder was avail on internet and should still be.

TNC choice is sort of >who cares< ? Most are very similar. I like KPC3 for size and KaNode capability and battery operation for emergency use.

How slow is packet would be a more appropriate question. Let's see...
The typical hammy connection would be 1200 baud, that's half duplex by
the way so we need to add the turn around times and delays. Assuming a
direct station to station, synthesized radio connection the average
exchange should take about 3.1 to 3.5 seconds per 256 bytes. Actually
that looks pretty good, but it will never happen. The realistic
transfer rate will probably be more in the neighborhood of 5 to 7
seconds per 256... If you are unfortunate enough to have to go through
a node or two the rate will probably drop to 12 to 20 seconds if it
works at all....

Pretty 'high-tech' egh?

Source record: 30791

All the more recent American releases follow the R.M.A. system of
which a typical example is
6A8-GT. In this system the first figure indicates the approximate
filament or heater voltage- 6
indicates a Voltage between 5.6 and 6.6 volts (0 indicates a cold
cathode). Lock-in types in the
6.3 volt range are given the first figure 7 (this being the nominal
voltage), but the normal
operating voltages remain at 6.3 volts.
The second symbol is a letter which is allotted in sequence commencing
with A, except that I and
O are not used; rectifiers follow the sequence backwards commencing at
Z. When all the single
letters of a Group are exhausted, the system then proceeds with two
letters commencing with
AB..

The final figure denotes the number of "useful elements" brought out
to an external connection.

The suffix after the hyphen denotes the type of construction used. G
for glass bulb, GT for the
smaller parallel-sided T-9 bulb; W indicates militry type.

>I thought the P3D antenna gain and power output was high enough to
>allow the use of omni antennas on the ground. Is this not true?

Wow, been digging in the archives. eh? P3D has a 10x larger power
budget than AO10 or AO13, but I think you'd be hard pressed to work
it using omni antennas when it is at apogee. I understand that it
is planned to be active on more than one mode at once, so the larger
power budget will be shared across more than one transponder at a
time. And while greater output power will make it somewhat easier
to hear, extra power supply at the satellite doesn't make it hear
you any better.

It is supposed to be 3-axis stablized, so squint angles shouldn't
be as much of a problem as they are for AO10, and were for AO13,
but I don't think that will be sufficient to allow you to work
it without a steerable gain antenna at your station. (At perigee,
of course, it should be possible to work it with an omni, but it
won't dwell at perigee long, and coverage will be much less than
when it is at apogee and a whole hemisphere will be in its footprint.)

It shouldn't take quite as elaborate an antenna system to work
P3D as it does to work AO10 (or did to work AO13). Fairly compact
beams should suffice. You shouldn't need anything like the 22 el
2m and 40 el 70cm long boom antennas I'm using for AO10. An 8 el 2m
and a 16 el 70cm antenna should do nicely (that's for CP, halve the
number of elements for linear polarization). That's a boom length
on the order of 6 feet. If you're running a good amp and have a
good mast mounted preamp, you might get away with even smaller
antennas, say a nested quad backed by a reflector screen (but
with decent antennas you shouldn't need to run an amp at all).

You shouldn't have any trouble setting up a workable antenna system
on a patio or balcony. You can cheaply build the antennas needed.
And as I noted in my original post, you can hand steer the antennas
as long as you aren't trying to work perigee passes. The molynia orbit
has a very long dwell at apogee so you don't have to reposition very
often.

The real digital action may be up at S band, and the needed antenna
for that can be quite small. A 1 to 1.5 meter dish should be plenty,
and that's easily handled on a tripod. You might even be able to
dual feed it and use it at L band as well. If not, a modest loop
yagi will do for L band. (I'll be using my 12 foot dish, because
I already have it, but I'm going to have to throttle power *way*
back to avoid being too strong at the satellite.)

P3D is going to be much easier to work than our previous molynia
orbit birds, but don't expect to work it at apogee with a microsat
class station. You'll want a receive antenna with a narrow enough
beamwidth to keep the warm Earth from affecting system noise
temperature (otherwise a low noise preamp will do you no good),
and you'll want a transmit antenna with enough gain to avoid having
to run an external amp. With my current setup, I expect to be using
less than 2-10 watts uplink power for mode U/V (the higher power may
be needed to burn through the treeline for near horizon passes). With
lesser antennas, you may need 25-45 watts uplink power.

The receive setup is really the key, however, as it always is with
satellites. You simply *must* have enough directivity to let the
antenna look at the cold sky. Otherwise system noise temperature
will be limited by the warm Earth, and you won't be able to compensate
by adding more preamplification. An antenna with a 3 db beamwidth of
22 degrees, and a good F/B ratio, should suffice for high passes.
A narrower beam will be needed for near horizon passes.

I recently purchased a used TNC, a MFJ-1270B. Before
I bought it, I called MFJ and asked the difference
between the 1270B and 1270C, and was told the only
difference is the amount of memory and the memory
expandibility. Wronnnngggg! From the docs, it appears
that the 'B is not capable of KISS mode. It looks
like all it does is simple "converse" mode QSO's.
Am I interpreting the docs correctly? Is there a
way to get it to run KISS mode? I plan to use it on
a Mac Powerbook, and could run SoftKISS, if there's
some way to access the modem directly.

I have also never had such short life. I get about 1 hour/day with comms on and 2 with comms off every day for a week on good Alkalines. I get a solid non-stop 8 hours with 900 mA/H nicads when running packet or tcp/ip and still have enough to carry on. I am just a little wary of going too low in cas my flash card corrupts otherwise I can run up to 12 hours on the nicads with comms operating.

Running an internal pcmcia modem will hammer the HP200lx batteries but I can still get 15 minutes a day on-line plus about an hour of non-comms stuff and alkalines will last about 5 days.

Traditionally, there has always been a 10dB discrepancy between
"AMSAT-promised minimum ERP" and realistic minimum ERP. This, of course,
mostly was because of the AGC action caused by alligator stations,
and on P3D the situation might be better because of the countermeasures.

Of course, directional antennas are always better because they help to
reduce noise as well. You can compensate the gain you get from the
antennas by using less output power.

What MFJ told you was correct, unless maybe it has an extremely old
version of firmware.

To put it into KISS mode, type:

kiss on <cr>
restart <cr>

The LEDs should blink up to three times (depending on the amount of RAM)
and it will be in KISS mode.

You have to do this in terminal mode. Any modem terminal software
should work. You can get a KISS-only eprom from TAPR
(http://www.tapr.org). I would recommend doing so, if you will
exclusively be using KISS, as sometimes the TNC cpu resets itself and
you would have to go through the process again.

1845. Help with interfacing HTX202 for packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-01 00:00:00 UTC
From: Jeff Gregor <hobbes99@ziplink.net>
Message-ID: <3341E1D3.74E6@ziplink.net>
Source record: 30799

I just bought my first packet TNC the other day (KPC-3+), but I'm having a severe problem hooking it up to my htx202 due to RFI. I've noticed this about the handheld before, that when I bring it into a room with a computer on it goes beserk (noise all the way up to s-10 on the scale). It doesn't seem to make a difference which computer, they all do the same thing, so I'm assuming that the problem is with the radio rather than just my system.
I see people with htx-202's hooked up to packet all the time (QST articles and whatnot), so I'm wondering if anyone else has had a similar problem or if there is something wrong with my individual radio.
Any suggestions/comments/information would be greatly appreciated!

1850. FS: TI 320C5x DSKs (DSP Starter Kits)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-02 00:00:00 UTC
From: Randy Cole <cole@netcom.com>
Message-ID: <3341E114.CD0@netcom.com>
Source record: 30804

I have several TI 320C5x DSKs (DSP Starter Kits) for sale. The TI part number is TMDS3200051. They are all brand new and have never been opened. The C5x DSK has been featured in several QEX articles, including
one last August about packet voice, and has been used very successfully in EME applications.

These kits are designed for students, experimenters, and developers who need a simple, low-cost way to prototype DSP-based applications for the TI 320C5x series of DSP chips. The kit includes a small (2.5" x 4") PC board with a TMS320C50 processor, a TI Analog Interface Circuit (AIC) chip with 14-bit A/D and D/A capable of sample rates to 19.2 K samples/sec, RCA jacks for analog I/O, and a 9-pin RS-232 host interface.
The kit also includes a simple assembler, loader and debugger for the PC, a kit manual and a TMS320C5x manual.

The latest versions of the software as well as several user-written demo programs can be downloaded from TI. The URL is:

ftp://ftp.ti.com/mirrors/tms320bbs/c5xdskfiles/

The board requires a 9 volt *AC* power supply capable of >250 ma. A 9 VAC
780 ma supply with the right plug is available for $8.99 from Radio Shack
(Part # 273-1630).

TI sells these through distributors for $99, and purchasing them from distributors can be a hassle. I'll sell them for $60 each shipped within
the US. Terms: Price is firm. The units are guaranteed against DOA. Immediate shipment if payment is by USPS or other money order or cashier's
check. Personal checks are fine but I'll wait a few days for them to clear.
At this price COD just isn't worth the hassle, so no CODs, please. If you
want one send me a message and I'll reply with the information you need to
order one.

I'm interested in working the Navy's PANSAT satellite when it goes up, but am still in the dark about SS. I heard it's going to be in the 440 band. Does anybody have any details about what it's going to take to work this bird? I've been looking up SS on the web and have found a couple things, but nothing about how to lock up the spreading codes at the RX or anything like that.

HELP!!!!!!!!!!!!!

Tyler
N3SPD

tyler@cyberia.com

the fake address in the "reply to" is to avoid spammers.

The sponsors of the project (US Naval Academy? USNA Postgraduate School?)
have a web page that apparently hasn't been updated in a while, but it
will give you the background information. You can find your way to it by
starting at TAPR's Spread Spectrum page- http://www.tapr.org/ss, and
there's a link to the PANSAT page there somewhere. If you're in the dark
about SS in general, the TAPR SS page is a great place to get up to speed.

From: Greg Albrecht <kf4mkt@garbage.bridge.net>

Hello Fellow Ham:

You are invited to join the South Florida Hams Mailing list (SFLHams)!
This is a unmoderated amateur radio topic based mailing list open to all
hams in South Florida. SFLHams topics can (and have) ranged from:
meetings, hamfests, emergencies, news and other events.

To Subscribe:
send email to- majordomo@garbage.bridge.net
& in the body of the email put- subscribe sflhams

Please make sure you do this from the address you wouldlike to receive
mail to, else use: subscribe sflhams email@overpriced.domain.us

Shortly Thereafter you should receive a confrimation message including
many other commands which can be used on the list. *IF* you have any
problems subscribing or with anything else involving this list please
```

contact KF4MKT (Greg Albrecht) (954)340-1458 (admin@garbage.bridge.net)

Have Fun!
And Rember: The more people you tell about this list, the more likely it is you will have something interesting to talk about.

KF4MKT

1854. radiosonde

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-02 00:00:00 UTC
From: tjp010@sp2.power.uni-essen.DE
Message-ID: <3342DAC3.ADC@sp2.power.uni-essen.de>
Source record: 30808

Dear Members,

some time ago I found a German weather-radiosonde for air-borne (baloon) measurements, Type E076. I could reactivate it because of only minor damages.

Technical details I found out:

Weight: 0.450 Kp incl. styropur case, without batt.
Power supply: 12 Volt Batt., switched by a reed contact
Oscilator Freq.: 100.95 Mhz
Output: <0.25 Watt
Modulation: FM
Sensors: Air-pressure, -temp., -humidity
Data transmission: 3 variable NF tone frequency bands, one for each sensor

The equipment I use:
-Different short wave receivers
-Ham-Com Ver. 3.0 plus Ham-Com demodulator on RS 232
-JV-Fax Ver. 7.0
-PC Weatherfax prof.
-Packetmon. 3.1
-self-written or adapted programs in TURBO-Pascal Ver. 6 & up

My questions:
Who knows more about the details of receiving and decoding the transmitted data?
Does someone have TURBO-Pascal procedures (source code) for parallel analyzing multiple frequencies?
Can someone give me a hint or a link on this subject?

Thanks to you all in advance,

Dr. Bunk

1997 ARRL and TAPR Digital Communications Conference
October 10-12, 1997
Baltimore, Maryland (minutes from BWI airport)

Web: http://www.tapr.org/dcc

It's that time again! Time to make your calendar and thinking about what to publish for the upcoming 16th Annual ARRL and TAPR Digital Communications Conference. 1997 marks the second year in which the ARRL Digital Communications Conference and TAPR Annual General Meeting have joined into one conference!

The ARRL and TAPR Digital Communications Conference is an international forum for radio amateurs in digital communications, networking, and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communications Conference is not just for the digital expert, but for digitally-orientated amateurs of all levels of experience.

The 1997 ARRL and TAPR Digital Communications Conference will be held October 10-12, 1997 in Baltimore, Maryland. This year's conference location is just minutes away from the BWI (Baltimore/Washington International) Airport.

Not only is the Digital Communications Conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any of the ham digital communications modes. This includes APRS operators, networkers, DX-Cluster Sysops, software writers, modem designers, and digital satellite communications enthusiasts. The ARRL and TAPR Digital Communications Conference is for all levels of digital operators -- a must conference to attend to get active on a national level. Now, more than ever, amateur radio needs this great meeting of the minds, since it is important that we demonstrate a continued need for the frequency allocations we now have by pushing forward and documenting our

achievements. The ARRL and TAPR Digital Communications Conference is one of the few ways to record our accomplishments and challenge each other to do more.

A Conference for the Beginner as well

The conference is not just for the digital expert. This year's conference will again provide an entire session strand with beginning, intermediate, and advanced presentations on selected topics in digital communications. Some of the topics will include: APRS, Satellite Communications, TCP/IP, Digital Radio, Spread Spectrum and other introductory topics. Come to the conference and hear these topics presented by the experts! Don't miss this opportunity to listen and talk to others in this area.

Symposiums and Seminars

In addition to the presentation of papers on Saturday, three symposiums/seminars will be held before and after the conference. These sessions are provided to allow those with additional time and interest to make the most of the Digital Communications Conference. For those that might have interest in just a symposium or seminar, registration for the conference is not necessary to register and attend one or more of the symposiums and seminars. This allows maximum flexibility for those that might want to participate during the Digital Communications Conference, but do not have an entire weekend to devote to the event.

A full day symposium on Friday covering APRS will be conducted by Bob Bruninga, WB4APR (father of APRS) , Keith Sproul, WU2Z, Mark Sproul, KB2ICI (developers of Mac and Windows APRS), Steve Dimse, K4HG (developer of javAPRS), and other nationally known APRS leaders. Join this group for the afternoon and evening for in depth discussions and presentations on the current and future status of APRS. This is a unique opportunity to gain insight into this fast growing digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning System).

Starting late Friday afternoon a half-day seminar entitled "RF Basics for Computer Weenies: Helping the RF-challenged get the most out of the new high-speed wireless toys". The seminar will focus on such topic as basic antenna types and their characteristics, comparison of feedlines and connector types, propagation basics (calculation of path loss, multipath effects, fresnel zones, etc), weatherproofing, lightning protection, filters, basic RF measurements, and other issues related to maintaining radio equipment on the UHF/SHF bands. This seminar will be starting late enough in the afternoon on Friday to allow those flying on that day to attend the seminar.

On Sunday morning, Dewayne Hendricks, WA8DZP, Phil Karn, KA9Q, and Tom McDermott, N5EG, will conduct a seminar focusing on "Spread Spectrum system design and theory." All three presenters are well known for their work in

various areas of amateur digital communications and this 5 hour seminar should be an excellent opportunity to learn about the design and theory of spread spectrum systems. This seminar is a follow up to the past two seminars of PCS technology by Dewayne with a new focus on system design.

2nd Annual ARRL and TAPR DCC Student Papers Award

ARRL and TAPR especially welcome papers from full time students to compete for the second annual student papers award. Two $500 travel awards may be given, one in each of the following categories: a) best technical/theory-oriented paper by a student, and b) best educational or community-oriented application paper by a student. The paper should relate directly to a wireless digital communication topic (see guidelines for more information). Papers coauthored by educators or telecommunications professionals are also eligible for this award, as long as a student is the first author. Deadline for receipt of finished student paper manuscript: June 20th, 1997. Please note that this deadline is different than the general conference submission date. For full details and paper guidelines contact TAPR or check http://www.tapr.org/dcc.

Call for Conference Proceeding Papers

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. If you know of someone who is doing great things with digital communications, be sure to personally tell them about this! Papers are due by August 20th, 1997, and should be submitted to Maty Weinberg, ARRL, 225 Main Street, Newington, CT 06111 or via the Internet to lweinberg@arrl.org. Information on paper submission guidelines are available on-line (http://www.tapr.org/dcc).

Local Co-Host

The 1997 ARRL and TAPR Digital Communications Conference will be co-hosted by AMRAD (Amateur Radio Research and Development Corporation).

The Amateur Radio Research and Development Corporation (AMRAD) is a worldwide club of amateur radio and computer experimenters whose purpose is to develop skills and knowledge in radio and electronic technology, advocate design of experimental equipment and techniques, promote basic and applied research, organize technical forums and symposiums, collect and disseminate technical information, and provide experimental repeaters. http://www.amrad.org

---

What can you expect during the 1997 ARRL and TAPR Digital Communications Conference ?

* A full day of papers, breakout sessions, and selected topics on Saturday for the beginner to the advanced amateur digital enthusiast.

* Three seminars/symposiums
Friday (1pm) - APRS, Conducted by:
Bob Bruninga, WB4APR
Keith Sproul, WU2Z
Mark Sproul, KB2ICI
Steve Dimse, K4HG

Friday 3pm - RF Basics for Computer Weenies

Sunday (8:30am) - Spread Spectrum System Design and Theory,
Conducted by:
Dewayne Hendricks, WA8DZP
Phil Karn, KA9Q
Tom McDermott, N5EG

* The second annual Student paper awards.

* TAPR Membership Meeting

* A banquet with Special Guest Speaker (TBA)

* SIGs (Special Interest Groups) on Saturday following the banquet.

* Informal get-togethers throughout the weekend.

* A meeting facility that is perfect for this type of meeting.

* Informal engineering discussions/demonstration areas.

* An event at which the most important new developments in amateur digital communications are announced.

* Digital 'movers and shakers' from all over the world in attendance.

Conclusion

If you have attended a Digital Communications Conference in the past, just remember back to how much fun it was discussing the latest developments into the wee hours! If you have never been, then make your plans now to attend and find out how much fun the Digital Communications Conference can be.

There are few activities where your participation can be so much fun, and so important! Getting together with colleagues from all over the world and bringing each other up to date on your latest work. All this, and more, for an unforgettable weekend of ham radio and digital communications. Make your travel and lodging arrangements now. We hope to see you at the ARRL and TAPR Digital Communications Conference October 10-12!

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road #337, Tucson, AZ 85749-9399. Phone: (817) 383-0000. Fax: (817) 566-2544.

Internet: tapr@tapr.org Web: www.tapr.org/dcc

Sincerely,
Steve Ford, WB8IMY, ARRL Conference Co-Chair
Greg Jones, WD5IVD, TAPR Conference Co-Chair
Paul Rinaldo, W4RI, Local Host Liaison
Steve Stroh, N8GNJ, Asst Conference Manager

Note: If you need handouts or flyers for meetings, contact TAPR about getting what you need!

Hotel Information

Conference presentations, meetings, and seminars will be held at the Holiday Inn BWI Airport. DCC special rooms rate is $89 per night. When making reservations with the hotel, be sure to indicate you are attending the ARRL and TAPR DCC to get the discount. It is highly recommended that you book your room prior to arriving - a block of 75 rooms is reserved until September 9th, 1997. After the 75 rooms are booked, rooms will only be available in nearby hotels. Be sure to book your rooms early! The hotel provides transportation to and from BWI Airport, nearby Amtrak/MARC rail station, and the local Baltimore Light Rail. Please contact the hotel to arrange specific transportation needs.

Holiday Inn BWI Airport (conference hotel)
890 Elkridge Landing Rd, Linthicum, MD, 21090
(410) 859-8400, Fax (410) 684-6778

Registration

Contact the TAPR office by Phone, Fax, or e-mail (Internet: tapr@tapr.org) to preregister or for additional meeting information. MasterCard and VISA accepted.

- Preregistration (before Sept 10th) $42.00 *

- Late Registration or at door $47.00 *

* - Conference Registration includes:
Conference Proceedings, Saturday Sessions/Meetings, and Lunch.

- Saturday Evening Dinner (Limited Space) $20.00 **

** - Dinner, Speaker: TBA, Prize Drawing

Seminar/Symposiums

Note: You do not have to be registered for the conference to attend one or more of the seminars/symposiums.

Friday, 1pm - 8pm.
APRS Symposium (full day)
Conducted by:
Bob Bruninga, WB4APR
Keith Sproul, WU2Z
Mark Sproul, KB2ICI
Steve Dimse, K4HG - Symposium Coordinator

- Registration $25.00 ***

Friday 3pm - 7pm.
RF Basics for Computer Weenies (half-day seminar)
Conducted by (TBA)

- Registration $20.00 ***

Sunday 8:30am - 1:30pm
Spread Spectrum System Design and Theory
Conducted by:
Dewayne Hendricks, WA8DZP
Phil Karn, KA9Q
Tom McDermott, N5EG

- Registration $20.00 ***

*** Cost of seminar or symposium includes the cost of handout
materials.

Contact TAPR to register for the DCC.
Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road #337, Tucson, AZ

1856. 1997 Dayton Hamvention PACK*BASH

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-02 00:00:00 UTC
From: Steve Stroh <strohs@halcyon.com>
Message-ID: <Pine.ULT.3.96.970402182944.4924D-100000@chinook.halcyon.com>
Source record: 30810

Attending the 1997 Dayton Hamvention? Then don't miss out on PACK*BASH!

What?
An event for the digitally-inclined ham, featuring:
* Buffet dinner
* Keynote address by Tom Clark, W3IWI
* TAPR special interest group meetings
* "Birds of a Feather" gatherings

When?
Friday evening, May 16, 1997
Doors open at 7:00 pm; dinner served at 7:30 pm
Speaker and meetings after dinner

Where?
NCR "Sugarcamp" Conference Center, 101 W. Schantz Ave. --
South of downtown Dayton, just west of Main St. (Rt 48).
Maps available on the TAPR web site (www.tapr.org) or at the
TAPR booth.

How?
Dinner requires advance registration and payment through TAPR.
Tickets will be available at the TAPR booth on Friday, though
we strongly encourage registration <before> Hamvention. The cost
is $20.00 per person, tax and tip included.

All amateurs are welcome to attend, enjoy the speaker, and
particpate in the meetings, although only those purchasing a dinner
can eat.

To register, contact:
PACK*BASH
c/o TAPR
8987-309 E. Tanque Verde Road #337
Tucson, AZ 85749-9399

Phone: (817) 383-0000
Fax: (817) 566-2544
Internet: tapr@tapr.org

Visa/Mastercard Accepted

Who?
PACK*BASH is co-sponsored by TAPR -- Tucson Amateur Packet Radio,
the national leader in digital communication -- and the Miami
Valley FM Association, Dayton's packet radio club.

For more information (including maps), go to
http://www.tapr.org/tapr/html/dayton.html, or send email to tapr@tapr.org.
You can request information via packet radio at BASH@N8ACV.#DAY.OH.USA.NOAM.

Jeff - I have used an HTX202 on packet for a few years with no problem
from the computers. I have had problems caused by my KPC-3 on freq
145.610 where there is a known "birdie" put out by the KPC-3. I now use
an AEAPK96 and have no problems on 145.610. There is a mod available
to shift the birdie if that is your problem. The folks at Kantronics
were great about providing info about how to fix it. Are you sure the
problem is the computer and not the TNC? Are you using an outside
antenna or the rubber duck? I have not tried it with the duck, but as I
said it works fine with an outside antenna. In fact mine is sitting in
between two computers and runs tcpip al day

Jeff, I use both the HTX-202 and 404 for Packet. I have had the same
trouble, and remedied it by using the Ferrite Chokes that are available
from Radio Shack on the line from the radio to the TNC. You may also
have to use them on the serial cable from the computer to the TNC. Also
make sure you use an external antenna, as the rubber duck will
defineitely pickup all kinds of noise from the computer and TNC.

1861. EMWIN with Baycom Modem

Newsgroup: rec.radio.amateur.digital.misc

Hello,

I am trying to get my Baycom Demodulator to work with EMWIN. I disconnected all the wires to my DB 25 except I moved the output to Pin 3 as they describe in their demodulators, but I get garbage. Any suggestions?

Thanks,
Dave, N3DT

1862. Re: Help with interfacing HTX202 for packet

Newsgroup: rec.radio.amateur.digital.misc

It doesn't seem to be a birdie problem, as it occurs on all
frequencies. The one thing I'm lacking is an outside antenna, I actually
just bought a nice 5/8 wave but we got 3 feet of snow monday night, and
I have to let it melt before I go climbing around on the roof :-)
I was having some noise from the TNC but I switched to a more shielded
cable and that helped some, I'll have to dig through my box and find
some ferrite chokes. At this point, my next idea was to get the radio
and the TNC out of the room with the computer all together, run the
thing from the next room with a very long serial cable, but that would
be a bit of a pain.
Thanks to all for the suggestions!

There is an option that will disable power to the serial port and thus
save on your battery life. It's in the setup menu where your battery life
is displayed called "Com1 port power in DOS". I keep mine turned off and
have not had any problems using this port.

All you need to do, Bob, is either type "KISS ON" at the command
prompt or you can get a KISS EPROM image and burn a new EPROM that
will have teh TNC in KISS mode all the time.

Greetings -

A common problem with TNCs based on the TAPR TNC2 is a harmonic from the processors crystal oscillator which just happens to fall on 145.01, or very close. I thought that Kantronics had corrected that.

But anything digital, including most computers, will generate broadband noise. A TNC is a computer.

You can often reduce the amount of trash by carefully filtering the serial input/output wires in the modem cable. Do it ON the circuit board inside the TNC - pins 2 & 3 of the DB25 connector to ground (pin 7 of DB-25 connector). .001uf (1nf, 1000pf) ceramic caps should be about right.

You may also want to do the same with the tx and rx audio lines where they reach the circuit board. And, don't forget the PTT line if your radio uses it.

HT antennas close to TNCs rarely work well. I made a little J-pole out of 300-ohm twin lead (plans are around several places). It is nice because it rolls up very small. I've used it in motel rooms with a 20'-30' piece of RG-174; yes there is lots of loss a 2M but you gain far more by separating the antenna from everything else. A little hook at the top to hang the antenna and some tape to fasten it to the inside of a window about take care of it.

Sorry, but I suspect that the KPC is not defective.

I'm wondering if anyone has run into this problem or knows a solution for it. I purchased the KPC-3 PLUS for field use, and now Kantronics is telling me I need an outside antenna to use it with my handheld transceiver. Here's the problem:

I'm connecting the KPC-3 PLUS to a handheld Yaesu FT50R transceiver. There is a HUGE amount of static showing up on the Yaesu on 145.010mhz whenever I turn on the KPC. I don't have to have any cables attached and the Yaesu can be 30 feet away in the same room and it still says the channel is active when I turn on the KPC. Does it sound like the KPC is defective or is this normal behavior? It's sort of a bummer since the major packet freq this way is 145.010. Thanks to anyone that can help!

(If you could please send email that would be great!)

>Bob Lyons, KI8AB

Just issue a "kiss on" command followed by a "restart"
command and you'll be in KISS mode. You can optionally
change to KISS-only firmware (ROM images available on the
TAPR website) which will force the TNC to remain in
KISS mode at all times. (The firmware which uses KISS
as only an option has a disconcerting habit of dropping
out of KISS mode unpredictably, mostly if there is a
power glitch.)

And of course all TAPR clone TNCs have a modem disconnect
header where you can gain direct access to the modem. This
header is normally used to allow the TNC to use a faster
and higher performance modem than the default Bell 202
modem included on board, but you can also use this header
to give your computer direct access to the on board modem.

Alas, those amateurs who are operating 20 years behind the current
amateur state of the art are indeed getting such poor performance.
And that is becoming a greater and greater embarrassment.

Those amateurs who are merely operating 10 years behind the amateur
SOTA are doing 47 times better by using 56 kb systems. And they
aren't paying the simplex store and forward penalty because they
are using duplex bit repeaters (akin to voice repeaters in principle)
rather than using the grossly inefficient simplex digipeater paradigm
with its inherent high latency penalties.

Amateurs operating closer to the current amateur SOTA are running
256 kb or 1.2 Mb (T1 rate) systems. US amateurs have been notably
slow to adopt near SOTA systems, but foreign amateurs appear to be
much more eager to do so. Slovenian amateurs are completing a
national T1 packet network right now.

The current amateur SOTA is held by 10 Mb and 100 Mb systems operating
at high UHF and microwave respectively. But few US amateurs have been
willing to adopt such systems to date. Partially that's because of the
myths that these frequencies are difficult to employ, and that they offer
only very short range. Neither is true. And partially it is because of
the difficulty in finding computer interfaces capable of handling such
rates. But mostly it is inertia on the part of the amateur community.
People who still cling to manual OOK Morse as the epitome of amateur
performance can't really be expected to shift their thinking much beyond

1848.

This is unfortunately a common problem. What is happening is that
you are receiving a harmonic of the reference oscillator in the
TNC. There are a couple of things you can do. The best solution
is to aggressively improve the shielding of the TNC. There needs
to be a fully bonded metal to metal contact of the case which
completely encloses the TNC circuit board. The MFJ TNCs with
their tin box construction are easy to fix. Just sand off the
paint at the mating surfaces of the case joints and add additional
sheet metal screws, spaced no further than 2.5 cm along the seams
as is standard VHF shielding practice. For partially plastic
cases, copper foil tape can be added to the inside of the plastic
case to complete shielding.

A quick and dirty fix is to just move the harmonic off frequency.
You can do that by adding a gimmick capacitor across the crystal.
A gimmick capacitor is made from a couple of short lengths of
insulated wire, I use enamel insulated wire but regular hookup
wire will work. Solder one wire to each side of the crystal
and then twist the wires together enough times to move the
harmonic off the desired operating frequency. The capacitance
between the wires is what does the job. The more twists, the
more capacitance you'll get. Enamel wire will give more capacitance
per twist due to the thinner dielectric provided by the enamel.
That allows a closer "plate to plate" spacing for the capacitor.

Since the crystal operates at a low frequency, only a small
percentage change in its operating frequency will move the
high multiple harmonic a relatively long way. The small change
in basic frequency won't upset TNC operation.

>Jeff Gregor / N1UDS

It is very unlikely that there is anything wrong with your radio.
Even a class B rated computer can generate enough harmonic hash
to disturb a sensitive HT. Most clone machines aren't even class
B rated. There are a number of things you can do to solve the
problem, and you may have to do several of them to completely
solve it.

The first thing to do is to lose the rubber dummy load and use
an outdoor antenna fed back to the radio by good quality shielded
coax, IE not the cheapy Radio Shack stuff. Separation is your
friend, getting the antenna away from the computer is an important
first step.

A more aggressive step is to improve the shielding of your computer.
You're trying to achieve VHF shielding, so the computer needs to
have a case capable of VHF shielding. The usual problem is that
the case joints are painted and use too few screws. Sand the paint
from the mating surfaces of the computer case, and add enough screws
to achieve a spacing of no less than one screw every 2.5 cm along
the seams. Make sure any unused backplane slot has its cover in
place, and that it is making good contact with the case. Cover
any unused drive openings with copper foil tape or copper mesh
screen. What you are trying to achieve is a complete Faraday
cage around the computer.

The monitor is often the worst offender. Do a test by turning
off the monitor. If most of your interference goes away, then
you've found the problem. Wire mesh shielding can be fitted to
the plastic monitor case to improve shielding. (It isn't necessary
to cover the face of a color CRT to achieve shielding, the internal

shadow mask does that for you, but for a monochrome monitor, you may need to cover the face of the CRT with fine wire mesh too. Paint such a wire mesh cover flat black and call it an anti-glare filter.)

It should go without saying that all external cabling should be high quality shielded cable. An external Earth ground connection for the computer and monitor is usually not effective, and often will cause the interference level to *increase* due to circulating ground currents on the grounding wires. All you need and want is a Faraday cage, such cages do not require a connection to Earth.

Don't forget your printer. They are often noise sources too. Keyboards are another source of RF noise. It is usually difficult to properly shield a keyboard, so the best course is to find one that emits little noise. I like the Focus 2001 keyboards for that. They are generally very quiet. Mice can also be a noise source, and again, trying different mice is usually the best solution.

In some cases, you may need to add ferrite chokes to your cabling to suppress common mode radiation from the cable shields. This isn't common, but is something to keep in mind if you haven't achieved a good Faraday cage around the noise sources.

You *can* quieten a noisy computer, but it does take a bit of work.

In article <3341b613.4992600@news.bctel.ca> masa@writeme.com writes:
> would you tell me what the packet radio is ?
>I am new to ham world, and I am confusing a little bit...

Packet is a method of sending digital data by radio. It does
this by forming the data into frames, called packets, and
sending them out wrapped in a protocol called AX25. This
protocol has embedded identification of the stations involved
in the header of each frame, a frame number, and a CRC error
check sequence. When such a frame is received, the receiving
station performs a CRC on the frame, and if it passes, sends
back an acknowledgement frame called an ACK. If the frame
fails the CRC, the receiving station sends back a NAK and
the transmitting station repeats the frame. If a frame is
so badly mangled in transmission that it is not received,
the sending station will repeat it after a preset wait for
an ACK or NAK frame.

There are other features of the protocol which allow multiple
stations to take turns using the same radio frequency. This
is done by monitoring the channel and not transmitting when
another signal is heard. There are timing features built into
the protocol which attempt to ensure that two stations don't
try to transmit at exactly the same time. This doesn't always
work, and when it doesn't it is called a collision. The stations
will then retry the frame in accordance with the protocol outlined
in paragraph one after a random wait. The random wait assures
the two stations will not *again* try to transmit at the same
time.

All of this protocol stuff is usually taken care of by a device
called a TNC, which appears like a simple modem to your computer.
But the protocol can also be done directly by your computer. Then
you require a special program rather than a simple terminal emulator.

TNCs generally contain a default radio modem. This is normally a
Bell 202 standard modem used half duplex. This gives you 1200 baud.
Other modems can be fitted to give higher data rates. At the highest
data rates in common amateur use, you abandon the TNC because it
can't keep up and go to a direct connection between the data modem
and the computer using a special interface card in the computer.
This is commonly required for 56 kb and faster data rates.

The modem signal is fed to the radio for transmission. Bell 202
1200 baud will usually work with an unaltered FM voice radio.

9600 baud K9NG/G3RUH modulation usually requires some radio
modifications to pass through a voice grade radio, and won't
work properly at all with some frequency synthesized voice radios.
At 56 kb and above, the modem *becomes* the radio. These RF modems
are purpose designed for the signals they generate.

Packet is inherently a cooperative mode of operation, and you need
to coordinate modulations and frequencies with others in your area.
Generally there will be one or more local *networks* setup in your
area to relay packet signals.

>be a bit of a pain.

It would probably be better to just remote locate the radio. Use
standard shielded audio cable between the TNC and the radio. Wire
it so the red wire is transmit, the black wire is receive, and
the shield is common. This will keep all digital noise far away
from the radio.

Hmmm, I kind of doubt it's the KPC. I used to velcro my HT directly on
my KPC-3 and never had a problem with with the TNC directly. Most of my
interferance problems come from cheap serial cables or serial cables with
multiple adapters and connectors. Quality cables and electrical tape on
adapters pretty much eliminated any problems I had. I would think that
Kantronics would take the time to remove any potential interferance
problems from their equipment, which makes me think your problem might be
elsewhere.

Hello.

I was trying to use a satellite to get the signal out and back, but it
did not work well. I tried many satellites, but none of them seemed
to work at all (I used the software to track down the satellite).

I have a 45W base station + 30cm antenna (it's in inside).

do you have any ideas ? are you usually able to talk to someone
easily over the satellite ?

Thanks in advance.

Message-ID: <3346dcdb.654434901@nntp.ix.netcom.com>
Source record: 30844

I recently acquired a Kantronic's KAM. On inspection, the ROM is KAMware version 5.0. I noted that the KaWin program will only work with versions of 7.0 or higher, due to it's reliance on some enhanced commands. Are there easy channels for upgrade, or do I need to contact Kantronics? Does anyone know what kind of cost is involved in upgrading to the current (or last) firmware upgrade for the KAM?

I really wanted to doubt it was the TNC also. I wanted to blame it on
cables,
but when I don't have any cables hooked up, and I have the HT 30 feet
away in
the same room, and I turn on the TNC, and it unsquelches the HT, I know
it
isn't a cable problem. It appears a few other people are having
problems with
static on 145.010 also. I'll have to give the electrical tape a try
though!

Thanks!

I'm having a problem with a TNC2, maybe someone could help me with it. A short time after I turn it on, the LED's go dim, almost out, and the terminal program loses communications with the TNC. I have noticed a warm/hot area on the board when this happens. My question, has anyone experienced this before? Also, what would be the easiest/best way to test a voltage regulator transistor? The warm area is between a voltage regulator xistor and some kind of IC. The IC has gotten hot to where I can't touch it because of this, I hope it's still good...
If anyone has any ideas or suggestions, please email me at eric@dam.net

Yes, two of the best, both of which support Windows, are XPWin 1.1.7 and Express 3.6. XPWin supports most popular modems while Express supports only the Hal units. A demo version of XPWin is available at:

http://www.goodnet.com/~gjohnson

I don't have a current site for Express 3.6 but, since it's a commercial package, I don't believe there is a demo available in any case.

Both work well, but have somewhat different approaches and interfaces. Express has some features usable in Clover that are unavailable in XPWin.

Packet radio with a Sound Card is possible with Linux Operating
system. You can use it with three speeds:
9600 baud
4800 baud
1200 baud

You sound card has to be compatible with Windows Sound System standard
or with Spund Blaster standard.

There are documents available on-line how to connect you radio
directly to the sound card. There are three options:

Parallel interface, Serial interface and through audio and mic input
on the sound card. You can probably connect to the 15 pin jack, also.

I think that Thomas Sailor is the author.

With the sound blaster card and linux you can work as if the sound
card was you "ethernet" connection to the NET (tcp/ip).

Cool stuff.

I'll paste the URL if you want but normally use any search engine:
"ax25-howto" and it will popup emmediately.

It is hard to figure out what info you need: basics or some advance
stuff.
Suffice to say that if you brother in law has a tcp/ip over his ax25
links you can send him messages directly form the internet via
"gateways" that do not violate regulations.

His address could be:
his_user_id%his_ham radio_station.ampr.org@the_gateway.anything_here.

Telnets usally won't work, neither ftp or finger. Maybe ping but I
doubt it.

If both of you are using ampr.org domain you can do anything (www,
ftp, telnet, mail, finger, ping, archie, ict) directly and you signal
will go via the internet without you intervention.

1901. advice needed for 9600 boud

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-06 00:00:00 UTC
From: poseidon@ziplink.net
Message-ID: <3347c4a6.68110083@news.ziplink.net>
Source record: 30713

Hi all on this newsgroup,
I am looking for an advice on what radio to buy to work 9600 baud. My
requirements:

1. Minimum 10 Watt
2. pass band tuning (not just one frequency)
3. either 2m or 70 cm or both
4. for less than $400.

Is yeasu 5100 a good candidate? It sells for $300+ nowadays.

>common???
>
>I appreciate your help, Thanks in Advance

If you plan to start with packet radio try not to start with 1200
baud. You will be better off with doing it at the 9600 baud speed.
You'll find many nodes operating at that speed.

Try using tcp/ip at the very start. That will give you a great
satisfaction: being able to rech anyone in the world without much
hassle.

Don't buy a TNC! Buy a packet interface cards since they will not
become obsolete when you'd want to shift to 19,200 or 56Kbps. the
cards are cheaper and faster. If you want to start with something
cheap you may want to buy a baypac modem (it is not a TNC:-)). It
should be attached to your parallel interface. It works with 9600 and
its cost is $96 american dollars.

Look for it here: http://www.tigertronics.com/

I hope you realize that there is baypac available at
http://www.tigertronics.com/ that works at 9600 baud and attaches to
the parallel port of your laptop. ($96.00)

That's acctually not in answer to your question, though :-).

>Telnets usally won't work, neither ftp or finger. Maybe ping but I >doubt it.

On my packet system, TNOS, I can FTP and Telnet to most any internet site I want. But even at 9600 it is slow. I have FTP'ed files from Borland's FTP site over packet radio with no problem. Telent generally would require a password unless the other site accepts anonymous telent connections.

>Has anyone ever heard of using a PL on a simplex packet freq.?

Yeah, its a bad idea. The decode delay is so long that throughput
on the channel is grossly affected, IE you have to run an incredibly
long Txd to allow the CTCSS decoder to function.

```
Attending the 1997 Dayton Hamvention?
Then don't miss out on PACK*BASH!

What?
An event for the digitally-inclined ham, featuring:
* Buffet dinner
* Keynote address by Tom Clark, W3IWI
* TAPR special interest group meetings
* "Birds of a Feather" gatherings

When?
Friday evening, May 16, 1997
Doors open at 7:00 pm; dinner served at 7:30 pm
Speaker and meetings after dinner

Where?
NCR "Sugarcamp" Conference Center, 101 W. Schantz Ave. --
South of downtown Dayton, just west of Main St. (Rt 48).
Maps available on the TAPR web site (www.tapr.org) or at the
TAPR booth.

How?
Dinner requires advance registration and payment through TAPR.
Tickets will be available at the TAPR booth on Friday, though
we strongly encourage registration <before> Hamvention. The cost
is $20.00 per person, tax and tip included.

All amateurs are welcome to attend, enjoy the speaker, and
particpate in the meetings, although only those purchasing a dinner
can eat.

To register, contact:
PACK*BASH
c/o TAPR
8987-309 E. Tanque Verde Road #337
Tucson, AZ 85749-9399

Phone: (817) 383-0000
Fax: (817) 566-2544
Internet: tapr@tapr.org

Visa/Mastercard Accepted

Who?
PACK*BASH is co-sponsored by TAPR -- Tucson Amateur Packet Radio,
the national leader in digital communication -- and the Miami
Valley FM Association, Dayton's packet radio club.
```

For more information (including maps), go to
http://www.tapr.org/tapr/html/dayton.html, or send email to tapr@tapr.org.
You can request information via packet radio at BASH@N8ACV.#DAY.OH.USA.NOAM.

1914. Setup disk for IBM PC/AT?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-06 00:00:00 UTC
From: Steve Stroh <strohs@halcyon.com>
Message-ID: <Pine.ULT.3.96.970406192759.12702G-100000@chinook.halcyon.com>
Source record: 30726

I've been asked to help resurrect a true blue IBM PC/AT for an elementary school class. This computer would be ideal for their use- they only need a dumb terminal emulator like ProComm to connect to a TNC, and then to a BBS. The PC/AT's battery ran out long ago and thus the PC/AT lost its CMOS setup info, so it can't even boot from a floppy disk at the moment (I'm not sure how I'll work THAT issue), much less from the hard disk.

I'm not aware of anywhere I can GET this disk... IBM's Web site doesn't have it (that I could find- I spent quite a bit of time looking). Can anyone suggest any other utilities that can set up the PC/AT's CMOS RAM?

Thanks for any leads!

Want to make MONEY fast?????

A little while back, I was browsing these news groups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $5.00! So I thought, "Yeah, right, this must be a scam!" as most people probably thought. But also like most people I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 5 names and address stated in the article. You then place your own name and address in the list at #5, remove the #1 person, and move everyone up a position, and post the article in at least 200 news groups. (There are more than 18,000 of them). No catch, that was it.

So after thinking it over, and talking to a few people first, I thought about trying it. I figured what do I have to lose except 5 stamps, envelopes, sheets of paper and $5.00, right?

Like most of us I was still a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the US. Post Office (1-800-725-2161) and they confirmed that it is indeed legal.

Then I invested the measly $5.00.................

Well GUESS WHAT!!!.. .Within 7 days, I started getting money in the mail! I was shocked! I still figured it to end soon, and didn't give it another thought. But the money just kept coming in. In my first week, I made about $20.00 to $30.00. By the end of the second week I had made a total of just over $ 1,000.00!!! In the third week I had over $5,000.00 and it was still growing. This is now my fourth week and I have made a total of just over $20,000.00 and it's still coming in......

It's certainly worth the $5.00 and 5 stamps. I spent more than that in one week on the lottery!!!

Let me tell you how this works and most importantly, why it works... also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. The process is very simple and consists of 3 easy steps:

STEP 1: Get 5 seperate pieces of paper and write the following on each piece of paper, "PLEASE PUT ME ON YOUR MAILING LIST." Now get 5 $1.00 bills and place ONE inside EACH of the 5 pieces of paper so the bill will not be seen through the envelopes to prevent thievery (THIS STEP

IS VERY IMPORTANT!!!). Next, place one paper in each of the 5 envelopes and seal them. You should now have 5 sealed envelopes, each with a piece of paper stating the above phrase and a $1.00 bill inside. What you are doing is creating a service by this. THIS IS PERFECTLY LEGAL!

Mail the 5 envelopes to the following addresses:

1) I. Guest
1800 A Hillcrest Rd.
Columbia Mo, 65203
USA

2) B. Gelsleichter
RR2 Box 272
Tunkhannock, PA 18657
USA

3) J. Hurless
3649 Yorktown Way
Boise, ID 83706
USA

4) C. Lanning
101-1537 Burnaby St.
Vancouver, BC V6G 1X1
CANADA

5) A. Cole
2580 W. State Road 28
Tipton, IN 46072-9787
USA

STEP 2: NOW take the #1 name off the list that you see above, move the other names up (5 becomes 4, 4 becomes 3, etc...) and add YOUR NAME as #5 on the bottom of the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as posible. Now, post you amended article to at least 250 news groups. All you need is 250, but remember the more you post, the more money you make! Don't know HOW to post in the news groups? Well do exactly the following:

FOR NETSCAPE USERS,

1) Click on any new group, like normal. Then click on "To:News", which is in the top left corner of the news group page. This will bring up a message box.

2) Fill in the SUBJECT with a flashy title, like the one I used, something to catch the eye!!!!

3) Now go to the message part of the box a retype this letter exactly as it is here, with the exception of your few changes. (remember to

add your name to #5 and move the rest up.)

4)When you're done typing in the WHOLE letter, click on "FILE" above the send button. Then, "SAVE AS..." DO NOT SEND YOUR ARTICLE UNTIL YOU SAVE IT!!! (so you don't have to retype this 250 times!)

5) Now that you have saved the letter, go ahead and send your first copy! (click the "SEND" button in the top left corner)

6) This is where you post all 250! OK, go to ANY news group article and click the "TO:NEWS" button again. Type in your flashy subject in the "SUBJECT BOX", then to the the message and place your cursor here. Now click on "ATTACHMENT" which is right below the 'SUBJECT BOX". Click on attach file then find your letter wherever you saved it. Click once on your file then click "OPEN" then click "OK". If you did this right, you should see your filename in the "ATTACHMENT BOX" and it will be shaded.

NOW POST AWAY!!!

IF YOU'RE USING INTERNET EXPLORER:

It's just as easy, holding down the left mouse button, highlight this entire article, then press the "CTRL" key and "C" key at the same time to copy this article. Then print the article for your records to have the names of those you will be sending $1.00 to.

NEXT

Go to the news groups and press "POST AN ARTICLE" type in your flashy subject and click the large window below. Press "CTRL" and "V" and the article will appear in the message window. ***BE SURE TO MAKE YOUR ADDRESS CHANGES TO THE 5 NAMES!!*** Now re-highlight the article and re-copy it so you have the changes...then all you have to do for each news group is "CTRL"and "V" and press "POST". It's that easy!!

THAT'S IT! All you have to do is jump to different news groups and ost away, after you get the hang of it, it will take about 30 seconds for each news group! ***REMEMBER, THE MORE NEWS GROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 250***

PL and packet just don't make much sense.

What is the reason for PL? It is to keep from keying other repeaters besides the one you want to use, or to keep it more or less private.

Packet is addressed and will key only the repeater (node, digi, switch) to which it is addressed. So, unless you're trying to somehow keep access limited, PL is not much use. And, with most packet nodes, you can implement a lockout list (budlist) to prevent undesired lowlifes from useing it.

Why do you want to use PL with packet?

Sorry to nitpick on an excellent summary on packet radio, but what are
NAK frames in AX.25 ?

NAKs (or NAK frames) are usually used in wire protocols with only two
partners, where the receiver implicitly knows who is the sender and
thus it is safe to send back a NAK. However, in cases when there are
multiple stations on the same wire (multi drop) or on the same RF
channel, the receiving station must know for sure that the message was
intended for it and it must also be sure who was the sender before
sending a NAK. This can be done safely only if there is a separate CRC
for the header indicating that the header is OK (and the error was in
the data part). Unfortunately, AX.25 does not have a separate CRC for
the header, so we do not know if the error was in the header or data
part and we do not have a valid return address.

In AX.25 (and X.25 from which AX.25 was derived from) the sender
inserts a frame number into frame and only waits a specified amount of
time for a positive ACK for the same frame number (or higher number if
multiple unacknowledged frames are allowed). If the positive ACK is
not received for whatever reason (lost during transfer to receiver,
CRC error at receiver, ACK frame lost, ACK frame contains CRC errors
etc.), the data frame is resent after the timeout period.

It doesn't actually sounds like you understand WHY this works for you.

Typically the folks that setup gateways protect themselves against
folks that will (out of ignorance) initiate illegal transactions via
their stations. It sounds like in this case the gateway owner is
actually proxying for the 44 net OR ucsd.edu has routing setup to a
gate in your area. Either way, the point is the local gateway owner in
your area is putting his ticket on the line by trusting the local
users to understand what is going on, and abide by the limits the FCC
puts on us. Sounds like, from what you said you are doing, that was a
foolish decision on his part.

Delete the 2 files PKDEF_.CFG and PKDEF_.DEF

If you do this you get a startupmenu where you can choose your comport
and speed.

Best to reset before your PK232 (only baudot leds burn) and then to
run the PP.exe

These 2 files contains the parameters for all modes and parameters for
pakratt himself.

Thanks for the info...I guess the main reason I asked the question is
that my brother-in-law does not have a TCP/IP, fast enough computer
equipment, nor the inclination to access the internet. I'm not sure
what he uses for a TNC, but he uses an 8086 computer.
Are there any intermediate stations, sites or networks set up to
translate between the two mediums?

By the way, my brother-in-law's name is Ron and his call sign is KM5HA,
in case you run across him. Tell him I said Hi.

Timewave has indeed purchased the data and software products of AEA. Currently the inventory, documentation, etc. is in transit. We are posting details first on our web site: www.timewave.com. Status concerning repair, new product shipments, tech support will be posted there first!.

Please help us by not calling us in the near term without first checking the web site. We are ramping up as fast as we can.

I,m not too sure if I,m in the right department here, butI am seeking information
on how I may be able to attach a BayMod96 9600Baud modem card (which by
the way is designed to attach to the parallel port) to a system currently using
JNOS111x6. If it is at all possible and someone has already done it I would
require the following (maybe more) information :-

1) How to setup CONFIG.H to compile it in.
2) Known drivers I would need to install and where to get them.
3) How to setup the NOS.INI/AUTOEXEC.NOS file to get it up and running
4) Anything I may have forgotten in the above.

>It doesn't actually sounds like you understand WHY this works for you.

Yes I do understand WHY this works, there is a gateway connection to internet. I do not FTP or telnet to sites on internet, but have been sucessful doing so, it surely does work. Generally I can telnet to other Ampr.org IP stations around the world because of this connection. And you can get to my system if you want. I have this box I am using now connected to a full time linux box via ethernet. I can use my dialup IP service and do so to download files through the ethernet to my linux box.

I was just answering that it is possiable to use a connection via packet radio and play internet provided a gateway is there, although quite slow at 9600.

That seems a little silly..Like, setting the HT at one end of the house and the tnc and computer at the other end? That just gives you more and more feet of wire to pick up noise..And serial port connectors do not like rf either, especially when you are running 40 feet of it..Hold on, i gotta run to the other end of the house to adjust the squelch, ill be right back :)

The htx-202 and mfj comba is notorious for wideband noise. I killed it here by putting 5 or so ft-50-43 ferrite toroids over the audio cable from the rig to the tnc. The snap-on ferrite at radio shack will also work. If making your own serial port connectors, make sure the cable shield is grounded at both the computer and the tnc! This cut it down to half for me, the other half was eliminated by the ferrite on the audio line. There remained about half to one s-unit of noise, and that was eliminated by slowly moving the radio around on the table, you can find little "Nulls" where the noise arrives out of phase with other noise and cancels. Now the packet setup sits 3 inches from the computer on the left, and two inches from the hf on the right, with no noise to any. And it was a lot easier to do than duct taping audio cable and serial port cable down the hallway..Hold on, i gotta run downstairs and adjust the squelch again (hihi)

It is much more than the decode time for the PL decoder.

>From experience, I have noted that the phase modulation from the low
frequency PL tones will introduce serious jitter in the data signal. At
4800 bps it totally trashes the data (actual experimental result), and
at 1200 it seriously degrades the data performance.

PL tones may be useful in cases where channels are shared between voice
and data. But the PL would have to be used on the voice signals not the
data signals.

Sounds like there may be a short somewhere that's causing
the regulator to overheat and shut down (via its protection
circuits, perhaps ... if it's a 7805 type, it will throttle back on
over current or over temp ...) What's the part number on the
IC that's getting hot? That may be what's pulling excess
current and causing the voltage regulator to shut down after
a short time ...

Maximov Publications and Leonardo

announce

Space Arts Workshop '97

On April 13, 1997, a select group of artists and scientists from around the world will be gathering in Paris, France to discuss the social and cultural aspects of exploring space.

Seventeen individuals will be presenting their works of art, speaking as artist as space explorers. Among these people, is artist Arthur Woods whose work, "Cosmic Dancer" flew aboard the Mir Space Station. Also speaking will be Richard Kriesche, artist of the first art project in the history of the Russian space flight, to fly aboard the space station Mir (1991).

The event will be broadcast over the Internet via Maximov Publications Special section on the Mir Space Station (http://www.maximov.com/Mir/). You can view the preliminary pages at

http://www.maximov.com/Mir/mirspaceart.html

The space arts meeting is being organized by ars astronautica, Leonardo - the Journal of the International Society of the Arts, Sciences and Technology, Maximov Publications, and the OURS Foundation.

Workshop members will go online to answer questions from users (April 13, 1997 at 4PM to 9PM GMT).

During the event, Amateur Radio Operators around the world will be relaying questions to cosmonauts aboard the Mir Space Station. In order to get the questions to amateur radio operators we are asking for submissions before April 13th.

*** CALL FOR QUESTIONS ***

We are requesting questions for both workshop members and cosmonauts. Please submit your questions to Mark W. Curtiss via email (mcurtiss@excite.com) or via the online form (http://www.maximov.com/Mir/mirspaceartstalk.html). Results for these pages will remain posted at this site for future reference.

Thank you

I do not know of any such equivalents...It would probably be possible
with a Linux station...
Meanwhile you need to contact your local coordinator. Don't forget
that he has to manually set the ARP table for you. So you need to
contact him anyway:-)

You can choose to work tcp/ip over raw ax.25 protocol or over netrom,
although the latter is less efficient (I didn't check that, though).

Greetings!

I e-mailed a query to the address in the TAPR Homepage about a 6 weeks ago and I can only assume that it has ended up in the big bit bucket in the sky. I hope I can get some advice here in this newsgroup.

I have an early model PK232 with daughter board modification in order to support support the MBX and Pactor options. I would like to upgrade to 96oo baud and the TAPR 9600 baud moden board would seem to fit the bill.

However, I notice that there are a couple of other associated kits that can come with it. One is the modem disconnect header. What does this do? Does this allow one to switch back and forth between the 9600 modem and the internal modems? Is it necessary to have this kit in order to save a lot of hassles?

The other kit seems to be a kit that will permit the installation inside the PK232 box. Is this correct? Can I not just use the connection via the header that is already on the PK-232 and leave the 9600 baud modem outboard? I understand that since I have the daughterboard, the installation is not straight forward and that there are some modifications necessary. Has any one done these modifications and are they difficult (I know it is a subjective query, but what the heck....)

Any advice on these matters would be appreciated.

Sincerely
Jim Cummings, VE3XJ

1944. Dumb Terminal for sale

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-08 00:00:00 UTC
From: Tom.Badura@bbs.mhv.net
Message-ID: <5idklrdan1@news.mhv.net>
Source record: 30748
Cross-posted to: alt.ham-radio.packet,rec.radio.amateur.digital.misc

I have a dumb terminal for sale. Hardly used/excellent condition. Can support speeds up to 19.2K baud. Why tie up your PC with packet radio when this terminal can do the same job? Never tried hooking up a TNC to this terminal, but I'm sure it can be used for packet.

TeleVideo 910+

12" Green monochrome screen
Built-in keyboard
Printer port, RS232C port
300-19.2K baud settings
Manual included

$30. Still interested? Reply to Tom.Badura@bbs.mhv.net. If you are in the Mid-Hudson Valley of NY state, you can see it (I'll demo it). Don't know how I would handle out-of-area replies ... if I ship it, the terminal weigs 30 lbs, so shipping would have to be added to the price. It's a good terminal ... proably would be good for packet.

1945. ic-207 & 9600bps?

Hi all,
does anyone know whether ic-207h has been succesfully used for 9600
baud packet without mods?

thank you.

If you know of any radios that are fit for 9600 bps can you please
suggest?

This may be a symptom of SCR latch up which can occur when a signal pin has a voltage that exceeds the power supply voltage by more than about 0.5V. This commonly happens when a piece of inadequately protected hardware is connected to another piece of hardware on a separate supply and the two supplies are not switched simultaneously.

However having said all this, equipment connected via an RS232 link usually have line drivers and receivers than are protected against such conditions (I assume by the removal of the parasitic SCRs that cause the condition.

Message-ID: <334BCD0C.446B@eds.tinker.af.mil>
Source record: 30661

OK, let's see...

Most of these are less than 200 Hz. 1/200 = .005
or 5 milliseconds. 1/100 = .010 or 10 milliseconds.

That's per cycle.

So figure at least 100 cycles to lock on, probably
more.

You have:

500 ms to 1 s you need to *add* to your TXD.

Just some elementary math to answer a common question,
and explain Gary's answer a little different.

Steve

Source record: 30662
Cross-posted to: alt.radio.scanner,alt.radio.scanner.uk,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.space,rec.radio.scanner,rec.radio.shortwave,uk.sci.weather

Hello fellow WEFAX FAX SSTV RTTY enthusiasts.

I've just updated by FTV program - current release is 0.98f
Download it from http://www.geocities.com/SiliconValley/2504

For the first time, I have released the software as full-featured
shareware.

FTV brings innovative digital signal processing and analysis techniques to
your multi-media PC. It can be used to receive images from Weather
Satellites and Terrestrial Facsimile Stations, text transmissions from
radio telex services, as well as Amateur Radio FAX, SSTV and RTTY signals.
It can also transmit Amateur Radio FAX and SSTV (Slow Scan Television). No
external hardware, other than a radio, is required, as all the necessary
signal processing is implemented in software.

FTV uses a SoundCard to decode:-
WEFAX weather photos from weather satellites
FAX wirephotos and meteorological maps (Supports FAX transmission)
SSTV pictures in monochrome and colour (Supports SSTV and SSTV COLOUR
transmission)
Baudot text (RTTY)

Here is a run down of soem of its hot features:

(1) It keeps the demodulated signal in memory, so that the signal can be
analysed again at a different keying rate or polarity! Garbage can be
resampled on the fly, which means that minutes of received signals decoded
at the wrong baud rate or keying polarity are recovered, on the fly, while
still receiving.

(2) Keying rate and polarity are analysed automatically - standard baud
rates are automatically set following analysis (assuming you have
calibrated your system as described in the documentation file
'readme.txt').

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

Take a look at my web site for futher details, at:
http://www.geocities.com/SiliconValley/2504

What can I say ? Try it, it's free, and may you have as much fun as I am
having...
And, keep me posted... If you have suggestions, you have got to let me

know!

73's from Brian.

>or is there something like RARP or a DCHP equivalent?

Most of the current amateur TCP/IP implementations use static subnet
routing in the switches, so addresses defacto have to be assigned on a
per RF LAN basis. This is handled by the area coordinators because
there are no dynamic assignment servers currently operating in the
amateur arena to the best of my knowledge. (It's possible, and legal,
and probably trivial to implement with a Linux host, but AFAIK it isn't
being done.) There are few dynamically updated nameservers in use, and
practially zero dynamically updated switches, so if you hop from LAN to
LAN, you could get an address dynamically and still not be able to do
anything useful with it over the network because there wouldn't be a
linkage between your hostname and your current IP address outside the
immediate LAN. (This is why we recomend that TCP/IP stations *stay put*
on their assigned LAN frequency.)

There is a list of the area coordinators on the the ucsd ftp site.

Is the TNC connected to a power source?
Is the HT connected to the same power source?

If yes to either, try with only battery power to both tnc and HT.

I have a HAL P38 that works fine for several hours, even days. Suddenly something shorts and the PC power supply kicks off. I know it's the HAL board because the same thing happens on two different computers, one a full tower with a 300 watt power supply. Anyone else experienced this problem?

I tried an ohm meter across each power input line and heating components individually - no luck.

It all depends on how your local network is implemented. Each group
is typically experimenting with a different mix of services. You need
to track down your local TCP network and make contact with the
keepers-of-the-network to find out about their portion of the AMPRnet.
The current list of coordinators is available at

ftp://ftp.ucsd.edu/hamradio/amprnets

As an example, here in eastern Colorado (44.32 and 44.20), we use
subnet routing by frequency (sure makes the routing tables simple :-).
So the IP address you would be allocated depends on the frequency.
We use 9600 and 1200 baud digital repeaters for wide-area coverage
to service our sparse population. Regional routers provide local
simplex channels. We're tied to the AMPRnet and, via a firewall,
to the Internet. Some info on our network is available at

http://www.rmsd.com/hamradio/dwg.html

~~~~~~
Ed,

The K2TL homepage: http://members.aol.com/jkktl/ham.htm has the
program WxSat which uses your soundcard to decode the Polar Orbiters
and Meteosats then displays the WAV file as a BMP. An excellent
compilation of SSTV programs is found at http://www.qsl.net/n9ngf/
Some of the programs are DOS and some are Win95. There are
descriptions and shareware to be downloaded directly from the site.
I'd have to do a search to find some other sources and my
ISP server is running s..l..ooo..ww.. tonight. Just search using
Webcrawler or Yahoo to find SSTV software, RTTY software, and
Wxsat links.

There is already a fairly extensive world-wide packet<>Internet network
in existance, with either TCP/IP or regular ax25 packet on the radio
side. However in my area, there is ZERO interest in TCP/IP over packet
even though I provide a TCP/IP gateway.

>Also is it possible for non-hams and hams to communicate
> via this integration? I have a brother-in-law who is a ham and uses
> packet in the Farmington NM area...would like to be able to communicate
> with him.

It is possible, but as a non-ham you can't legally can't gateway out the
radio port of a gateway. I don't allow any non-hams that permission on
my gateway.

If your b-i-l has access to a local packet to Internet gateway, you can
communicate with him by:

- telnet to the gateway and leave him mail on the bbs/gateway (probably
not allowed by the sysop to non-hams)
- send him e-mail to the gateway

Once you obtain your license, there are more options:

- meet him on the ham conference bridge
- gateway to his home packet station and leave him mail
- hold a keyboard chat with him on a local converse bridge (like a
feature of KaGold, some BBSs)

Hope this helps,

To all of you radio amateurs out there ! A plea for help from
someone bogged down at the moment.
I have obtained the wxsat software which works perfectly with
prepared .wav or .bmp files. I have also obtained a sound card (Idema
sound card series Schubert which is a 16bit ES1868 card) This has been
set up with port 220H, interrupt 10 [to avoid clashes with network card
set to 5] and DMA 1. It is set for wave file processing at 11.025kHz,
mono, 8 bit
No matter how I try I cannot produce a .wav file from the system
even though the input (into the audio plug on the card) produces sound
from the monitor speakers. I can also play CD's via the CD player,
but....NO .wav file at all. I have tried live signals, and recorded
signals all to no avail. I have even tried to contact ESS technologies
in the States by e-mail but have had the message returned with this
address unknown. So at the moment I am having to suck my thumb, mainly
since I am neither a radio amateur or a computer "literate". The
setting up of the system was done for me as I am essentially an amateur
climatologist (retired).
So, can any of you boffins out there throw any light on my
problems and even suggest what I can do to get a .wav signal. Have I
got a duff sound card ??
Thanks for any help or guidance,

--

From: robin@juno.com
Message-ID: <19970410.063126.5207.5.Robin@juno.com>
Source record: 30677

Hi,

I'm looking for a way to "try out" packet radio. I've heard that there are packet BBSes that offer access by landline - like you could call on the phone via modem and, once you were "authenticated" as a real live licensed Amateur, have full access to a packet BBS using the phone line.

Is there a listing of such landline-accessible packet BBSes? I'd love to know if there are any near me (in the 352 area code) I could try!

Okay now I'm s'posed to say that I do NOT have access to Usenet, not the traditional way at least. I'm using a li'l e-mail trick to post this, but if you reply to the group and not to my e-mail address I'LL NEVER SEE IT. So pleeeeease, if you reply, reply in E-MAIL to Robin@juno.com.

Thanks and 73,
Robin KF4OCP

MSK is a special form of narrow-shift FSK that can be generated
by either quadrature (I/Q channel) methods, of by proper shaping
of the baseband signals going to an FM modulator ... it can also
be received either coherently (like PSK with I/Q techniques) or
non-coherently (with an FM detector).

Check the TAPR web site ... the book they offer ("Wireless Digital
Communications Design and Theory" by Tom Mc Dermott, N5EG)
is a VERY worthwhile investment in an excellent tutorial on
practically all aspects of digital radio ...

Hi All;
...first time to this group. I'm interested in acquiring
Differential Global Position System (DGPS) data from the terresrial DGPS
broadcasting transmitters around the country that supply correctional data
for realtime GPS receivers. They use a form of MSK on an LF carrier
(approx. 250 -350 Khz). I've been all over the internet these last 2 weeks
and haven't found any real useful info on how to demod this. I'd like to
'roll my own' if it's reasonable to do so, perhaps starting with a
conventional receiver that can go down to 250Khz followed by an MSK
modem(??) that could extract the data from the audio.

Can anyone advise me on the subject and/or point me in the right direction?
I sure need some help!!!

1976. TAPR offers the Motorola ONCORE VP GPS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-10 00:00:00 UTC
From: Steve Stroh <strohs@halcyon.com>
Message-ID: <Pine.ULT.3.96.970410183329.12460A-100000@chinook.halcyon.com>
Source record: 30682

TAPR offers the Motorola ONCORE VP GPS

TAPR has worked a deal to provide the popular Motorola ONCORE VP GPS engine at a savings for TAPR members. This now allows TAPR to provide a low-end and high-end GPS engine to our members. For full details and pictures of both GPS group purchases, check out http://www.tapr.org/gps/ for full details.

The price of the Motorola ONCORE VP GPS is:
$269.00 US for members of TAPR
or
$290.00 US for non-members

and will include:
* Motorola ONCORE VP (B4121P115x) engine (2.00 x 3.25 x 0.64 in.)
* Documentation

TAPR will be taking orders for 10+ units, which is the minimum purchase at this time. Once at least 10 units have been purchased, TAPR will order the ONCORE VP units. TAPR will deposit money when the units are ordered and ship when the units arrive at the office.

Please note: This is not an enclosed/sealed unit. It is assumed that the purchasers will be installing the unit in another enclosure for normal and experimental operations like the TAC-2 (Totally Accurate Clock) kit designed by Tom Clark, W3IWI, or the APRS MIC-Encoder for APRS tracking. Both kits will be available at Dayton!

No 10% Discount for TAPR Members. Due to the nature of the purchase, the $269 purchase price for TAPR members represents the membership discount.

Warranty. TAPR will provide replacement units for DOA units that are promptly reported by the purchaser within 90 days after TAPR ships.

This is not a purchase list, method of payment is expected when you place your order.

If you would like to order one of these units, you can
e-mail tapr@tapr.org,
phone (817) 383-0000, or
fax (817) 566-2544.

Office Hours: Tuesday - Friday 9am - 12pm, 3pm - 5pm Central Time

Questions concerning the unit and details on the buy will be handled on the TAPR APRS Special Interest Group list. To subscribe, send e-mail to:

listserv@tapr.org.
In the message type
subscribe aprssig YourFirstName YourLastName.
The server will then send you a message back. Announcements on the status of the shipment will be made to the TAPR APRS SIG and TAPR-BB lists.

Shipping and Handling
---
* Shipping and Handling within the US will be $7.00 US by UPS Ground unless otherwise requested by purchaser.

* International Shipping will need to contact the TAPR office and get a quote on the shipping to your country. TAPR uses International Express Mail, unless the purchaser requires something else.

=46requently Asked Questions
(from a message by Tom Clark, W3IWI)

=46or this group purchase, the VP was chosen in lieu of the stripped-down UT & GT versions as a "does everything for everybody" universal solution -- solving the needs of the "where am I?" and "what time is it?" communities. And FYI -- the ONCORE works just fine in a balloon (no altitude limits) or airplane (travelling slower than Mach 2).

The original ONCORE was called the PVT6 and later renamed the ONCORE BASIC. It was a 70x100 mm board, had on-board DC-DC converter so that it could run from virtually any supply voltage (10-40v) and had a "real RS232" interface. Most of the BASICs were 6 channel, but a few were delivered with 8-channel firmware.

The original PVT6/BASIC served as the basis for Tom Clark's, W3IWI, original "Totally Accurate Clock" which has proved itself by delivering 20-40 nsec timing accuracy & precision. Some TAC results can be gleaned in the .gif plots on my FTP servers:

ftp://aleph.gsfc.nasa.gov/GPS/totally.accurate.clock/ or
ftp://bootes.gsfc.nasa.gov/GPS/totally.accurate.clock/

The original BASIC was phased out over the past couple of years, replaced by the slightly smaller & lower cost ONCORE VP. To make the VP smaller and save money, Motorola decided to drop the DC-DC converter (+5v supply only) and drop the "true RS232" interface in favor of an inverted-TTL serial port. While the original BASIC cost ~$400-500, the VP is now available for around $300.

Both the BASIC and VP came with a wide range of extra cost options (all of which are firmware only -- the hardware is identical). These options include a 1PPS pulse (required for the TAC), carrier phase and DGPS outputs.

In the past year, Motorola has announced two stripped-down versions of the VP targeted to specific markets -- the UT and GT. The UT was designed for the timing market and has most (but not all) of the high-accuracy timing features available in the VP. The GT is designed to be embedded into

automobiles and has only position determining capabilities. One of the things that Motorola removed from the UT/GT was the ordinary, mortal ASCII NMEA messages; the GT/UT talk/listen only to proprietary Motorola binary messages, and the binary command set for each is a subset of that available in the VP/BASIC. The prices are ~$150 for the GT and ~$210 for the UT.

TAC-2 Project

About a year ago Tom Clark, W3IWI, approached TAPR about his TAC-2 project (Totally Accurate Clock) http://www.tapr.org/tapr/html/tac2.html The kit will be available before or Dayton '97.

The TAC-2 can be thought of as a "universal" OEM GPS receiver adaptor with "plug 'n play" support for any of the Motorola ONCOREs, the Garmin GPS-20 or the Trimble SK-8 receivers. It has onboard all the "real RS232" interfaces (including a 1PPS signal on the DCD handshaking line), low-impedance (lab quality) pulse drivers and power supplies you need. It also serves as a platform for the (still being developed) TAC Oscillator Controller (TOC) which will give amateurs a 1:10e9 to 1:10e10 lab-quality frequency standard (locked to GPS). The TAC-2 (complete with any of the OEM receivers) occupies a 3"x4.5"x1" volume and has a large number of user options, including

- an optional switching power supply for battery use
- "UPS" power for uninterrupted operation
- power for external GPS antenna preamp
- Mounting in your PC as if it were a disk drive
- "smart" RS232 ports for DGPS applications

MIC-E Project

The other project that the VP can be used for is the APRS MicEncoder Project http://www.tapr.org/tapr/html/mic-e.html. The MIC-E (Mic Encoder) installs between your radio mic and radio and allows your GPS unit to transmit APRS AX.25 frames at designated intervals without needing a TNC! The result is a 1200 baud position report compressed to 32 bytes including beginning and ending FLAGS. This equates to about 320ms, including CALLSIGN, DIGIPEATER PATHS, and a minimum message capability. Plus, the packets are still receivable on ANY AX.25 TNC. Very useful in many settings.

The MIC-E excepts a wide range of GPS, which the VP is one of them. You can listen to a discussion of the MIC-E by Bob Bruninga, WB4APR, while Bob uses one or read over the text about the APRS MicEncoder (http://www.tapr.org/tapr/html/virtual.html). This unit will be available on or before Dayton 97.

General Characteristics:

Receiver Architecture
* 8 channel
* L1 1575.42 MHz

* C/A code (1.023 MHz chip rate)
* Code plus carrier tracking (carrier aided tracking)
Tracking Capability
* 8 simultaneous satellite vehicles

Performance Characteristics:
Dynamics
* Velocity: 1000 knots(515 m/s) > 1000 knots at altitudes < 60,000ft.
* Acceleration: 4 g
* Jerk: 5 m/s3
* Vibration: 7.7G per Military Standard 810E
Acquisition Time (Time To First Fix,TTFF)
* 20 sec. typical TTFF hh (with current almanac, position, time and ephemeris)
* 45 sec. typical TTFF (with current almanac, position and time)
* 2.5 sec. typical reacquire
Positioning Accuracy
* Less than 25 meters, SEP (without SA) [DoD may invoke Selective Availability (SA), potentially degrading accuracy to 100 m (2dRMS)]
* DGPS accuracy 1-5 meters typical
Timing Accuracy (1 pulse Per Second, 1 PPS)
* 130 nanosec. observed (1 to) with SA on
* In position hold mode, <50 nanosec. observed (1 to) with SA on
Antenna
* Active micro strip patch Antenna Module
* Powered by Receiver Module (25mA @ 5 Vdc)
* Passive antenna configuration (see optional features)
Datums
* 49 std. datums, 2 user defined, default WGS-84

Serial Communication
Output Messages
* Latitude, longitude, height, velocity, heading, time, satellite tracking status
* NMEA-0183 Version 2.00 (selected formats)
* Software selectable output rate (Continuous or Poll)
* Broad list of command/control messages
* TTL interface

Electrical Characteristics:
Power Requirements
* 5=B10.25 Vdc 50 mVp-p ripple (max)
"Keep-Alive" BATT Power
* External 2.5 V to 5.25 V 15=B5A (typ.) 60=B5A (max)
* 3V on-board battery;15=B5A (typ.) 60=B5A (max)
Power Consumption
* 1.1 W @ 5V

Physical Characteristics:
Dimensions
* Receiver 2.00 x 3.25 x 0.64 in. [50.8 x 82.6 x 16.3 mm]

* Active Antenna Module 4.01 (dia.) x 0.89 in. [102 (dia.) x 22.6 mm]
Weight
* Receiver 1.8 oz. (51g)
* Active Antenna Module 4.8 oz. (136.2 g)
Connectors
* Data/Power: 10 pin (2x5) unshrouded header on 0.100" centers
* RF: Right Angle OSX (subminiature snap-on)
Antenna to Receiver
* Single coaxial cable (for active antenna-6 dB Interconnection max
loss at Ll;1575.42 MHz)

Environmental Characteristics:
Operating Temperature
* Receiver Module -30=BAC to +85=BAC
Humidity
* 95% noncondensing +30=BAC to +60=BAC
Altitude
* 60,000 ft.(18km)(max)
* > 60.000 ft.(18 km) for velocities <1000 knots

Miscellaneous:
Optional features
* 1 PPS timing output
* Raw measurement data
* On Board Rechargeable Lithium battery
* On board LNA option for use with passive antenna
* Differential GPS-standard software feature
DGPS
* RTCM-104 format (remote input)
* Motorola custom format (master output and remote input)

Notice about all TAPR Group Purchases
TAPR coordinates group purchases as a service to help amateur radio operators obtain access to technology at prices better than those typically available in individual unit orders.

Those participating in group purchases must understand that these products are not part of TAPR's standard offering, that TAPR may not have an established relationship with the vendors involved, and that the terms of the purchase may be changed, or the purchase may be canceled, for any reason. If purchase terms (such as price or delivery schedule) significantly change during the order period, TAPR will notify you and permit you a reasonable time in which to cancel your order; if you choose to cancel, TAPR will refund any money you have deposited for the purchase. Once TAPR has committed the group order with the vendor, no further cancellations are permitted. IN NO EVENT WILL TAPR'S LIABILITY TO YOU EXCEED A REFUND OF ANY MONEY YOU DEPOSITED FOR THE PURCHASE.

Although informal support for products may be available through TAPR's on-line mailing lists and other services, product warranties and

entitlement to post-sale support are limited to what is offered by the manufacturer, and are not TAPR's responsibility.

1979. Help a 10-year old new ham

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-10 00:00:00 UTC
From: Kevin McCoy <kmccoy@dnaent.com>
Message-ID: <334D0A1E.5F9E@dnaent.com>
Source record: 30685

Greetings!

My 10-year old son just got his Tech license last week - KC5ZTM. I have a 2m HT and I got a BayPac modem with Baycom to get him interested in packet. We were able to connect to a local node, and from there access TexNet and some nearby BBS's. But what he really wants is to communicate with some other hams in realtime (a packet QSO), not just interact with machines (BBS's, etc).

We've tried to CQ on TexNet, but no responses, so far. I'd like for him to have a little success before he gives up in frustration and turns his attention to the web.

Thanks!

Kevin McCoy kj5pm

Hello all: is anyone using this decoder ? If you are what do you think ?
Is it worth the price and what modes are you receiving in plain text.

What is de shift (and/or datarate)?
When the receiver has a suitable narrow-band FM mode you could get the
audio from the demodulator (not via al the filtering and AF electronics
but as directly as possible from the demodulator) and feed it through
a suitable slicer to decide between '1' and '0' bits.

Cedrick, When you say that you have the WxSat software, I
assume that you are talking about the Windows program. Are
you running Win95? If so you should be able to enable the
soundcard control panel from the tray. See if the WAV block
is disabled or if the WAV volume is turned all the way down.

NO FLAME INTENDED, please - I think the world of TAPR. Since outfits
like E&B Marine are selling excellent Garmin units for as little as
$149.95 for the GPS 38 and the full-featured GPS II for $247.95, and
both have computer interfaces available, what makes this deal
attractive?

Thanks,

Larry - W1HJF

I have not studied all the specs in detail, but I am quite sure there is
an article on the TAPR website by Tom Clark, which outlines the
major differences between the Garmin unit and the Motorola
unit ... if memory serves me, the accuracy of timing signals is
quite a bit better with the Motorola unit for one thing ... this is quite
a benificial feature for those who are intending to use the units as
the basis for time and frequency standards ...

Check out the article ... I think you'll find the reason(s) why Motorola is able to charge more for their unit than some of the less expensive ones (which, I'm sure, work just fine for general navigation uses and are fine products for the price ...)

Kevin. Look at the HEARD function for the TNC program. Make a note of
the calls you see. Get a callbook or enlist the services of a local ham
club to get you in touch verbally with some of these folks. Explain the
situation to them.

My bet is that soon you will have access to a number of people that will
either take the time to listen and help or will point you to others that
do have the interest and will take the time.

Keep trying! GeoCities has evidently been having some serious problems lately. Last night I couldn't even get to my own page the first time I tried. The problem seemed to come and go every few minutes, or less.

Subject: [TAPR-BB:340] Update TAPR Oncore VP Purchase

I made mistake when I did the section on General Characteristics for the
Oncore VP GPS unit.

The unit does not come with an antenna, as was listed in the General
Characteristics section.

Sorry about the confusion.

Cheers - Greg

I downloaded and tried to get FTV to work. I spent about four hours poring over the documentation, making sure I had things set up properly (as determined by the text files), and then I spent another two hours trying the program out on different signals

Nothing.

I uninstalled the program.

To be fair, FTV may be an excellent program. It simply did not work on my machine: Win95 with OEMSR2.

MSK is frequency modulation with modulation index = 0.5.
This is a lower modulation index than normally used for,
say, voice on NBFM, but you can still demodulate it with an FM demodulator.
Best performance is obtained from a coherent demodulator. These
can be rather complex; at the expense of some S/N you can use
a conventional FM demodulator or a chip-based demodulator
(providing the IF and demodulator bandwidths match the DGPS
signals), then use a data slicer and digital processing after
that. Consumer Micrologic Ltd (CML) have some MSK ICs that might
be worth looking at for this application.

>$149.95 for the GPS 38 and the full-featured GPS II for $247.95, and
>both have computer interfaces available, what makes this deal
>attractive?

What makes this attractive is that the Motorola unit has much less
clock jitter in its time reference output than those other units.
That allows an order of magnitude improvement in accuracy for the
Totally Accurate Clock project.

This is a separate thing from positional accuracy, which is limited
by SA in any civilian unit, or from the time output on the RS-232
interface, which is only accurate to about +/- 200 uS anyway due
to the async nature of the RS-232 interface (it is typically much
worse than that depending on the sequence of NMEA sentences being
used). The NMEA time sentence on the RS-232 link is virtually
worthless for precision timing purposes.

This precision reference involves the "tick" signal you can extract
from the unit internals for processing externally into a clock
reference tracable to the atomic clocks on board the GPS satellites.
That can be made to be as good as 1 part in 10^-12 (long term) if
you have a tick with low and statistically predictable jitter.

Now there are a number of uses for a very precise time reference.
One which is useful to amateurs is to use it as an external clock
for a system of high rate spread spectrum stations. This neatly
dodges the receive clock synchronization problem for very weak SS
signal recovery. That's the main thing which limits how weak a SS
signal you can recover.

There are other uses for a precision time reference as well. Some
are as mundane as calibrating your frequency counter's timebase to
a NIST tracable source. Others are much more exotic, such as synthesizing
a very precise and narrow antenna lobe from an array of widely separated
transmitters or receivers, IE synthetic aperture systems. This allows
such things as very precise RDF without requiring a dish of 1000 meters
diameter.

TAPR also offers the Garmin GPS core for those with less demanding
timing applications. It is much cheaper, but much less precise as
well. Its "tick" has jumps of several nanoseconds at unpredictable
intervals which make it less useful for really precise work. (This
is due to differences in the way the cores are designed. It doesn't
affect positional accuracy within the limits imposed by SA, so it
doesn't matter if you are using the GPS for position information,
but it does matter if you are using it as a very high precision
clock reference.)

As Chicago said, "Does anyone *really* know what time it is?"
Probably not, but with the Motorola core you can come closer
than with the Garmin core to the answer to the question, "What
time does the NIST think it is?"

Rich, I used to have a Model 100 and used it with packet with no
problems.. other than the small screen display. Just set you baud rates
between the tnc and Model 100 to match and it should work just fine with
the built in terminal software... 73 de wb5nbq

may i humbly suggest rtty or pactor instead of packet? packet's really
good at not real time communications where as things like
rtty/pactor/amtor are more interactive with quicker response times...

he could operate 3rd party if it's a question of doing the demo on HF..

Well, you have set out on a task which is not so easy... but ought to be. Here is why.

Packeteers tend, now days, not to sit there watching the node frequency with MON ON. CQ does not work unless there are folks doing that. Pure and simple.

I am not sure what facilities are available from TexNet but NetRom (and its derivatives such as MSYS, G8BPQ, TheNet, etc) usually gives you two things.

One is a (U)ser list. It gives all of the current connections, ingoing, outgoing, and thru. Any one listed as an uplink or as the destination of a downlink is on that frequency. Unfortunately, its not too smart to try to connect to a station on that list because most packeteers don't know how to handle multiple connects, and that is what would happen. But, come back in 15 minutes after they have disconnected and try.

Better is to use the (H)eard list. For some servers, it is J (Justheard) or JH. This is a list of those stations on frequency which have been heard recently. Try any station on that list which is not currently connected.

Even better would be the converse server which is available on many nodes. G8BPQ and MSYS have this, and so does NOS, JNOS, WNOS, TNOS, etc. G8BPQ even offers a wide-area converse which is moderately popular in the Portland Oregon area near me. I don't know what TexNet has along this line.

Look hard. Something sure ought to be there.

Fighting against you, unfortunately, is the tendancy to view packet as a non-qso medium. In many areas, it has become this. Wish it was not so!

Live packet is kind of rare, you have to monitor the frequency and watch
when someone drops from a BBS or another system. Once you see the <DM> from
the station appear send a connect request to him (or her!): I.E.:

C callsign <enter>

If the person is still on you should connect.

Tom

Planning to move from 9600 to 19,200 using
Tiny2 Mk2 or Spirit TNC for our mail link on
our packet server.

Our system now uses loaned Kenwood 440 rig mod'd to
9600.
Was planning to convert spare Mitrek on UHF
to 9600, by removing active spatter filter for bandwidth...
Does anyone have any experience connecting this type
of rig to higher speed TNC's???

2000. TNC-2 ROMs available?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-11 00:00:00 UTC
From: landisj@nad.com
Message-ID: <1997Apr11.153622.700@main03>
Source record: 30706

Hi there,
I have a friend who recently bought a couple of old MFJ TNC-2s (1270?) at a hamfest. They were connected with a cable to form a node stack. Upon his returning home he discovered that the proms were missing. How does one go about obtaining the original proms for these? Are they available from MFJ, or perhaps TAPR?

Thanks,
Joe - AA3GN

Hi,

Thanks for reading this message.
I would like to know if anyone has wrote any packet software that will work
with a
hand held PC and Windows CE.
If so, could you please tell me where I could get a copy of the software
and any comments that they might have on the software.
Also what the software will do.

Thanks for any help.

Is a TNC (or similar type of modem connecting computer to radio)
required
in a system where you already have the capability to send text directly
from the Computer to the Radio? I'm assuming this means that my radio
has a built-modem.
But, how would I implement AX.25 or some other packet switching
protocol without a TNC?
More specifically, what is the role of the TNC? Can software handle
the packets directly, and drive error handling, compression, and routing
protocols?
Thanks,
Paul Timmins

2010. Re: Model 100 on packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-12 00:00:00 UTC
From: Paul Munsel <n5xmv@myriad.net>
Message-ID: <33502EE1.122B@myriad.net>
Source record: 30618

Rich, the Model 100 works pretty good for portable packet, if you are not looking for anything extravagant. It has it's own terminal program, but as far as I know it will not work with the BP-2. You may be able to right a program in Basic that will work, but you would be better off getting a standard TNC-2 such as the KPC-3 (small size), or an MFJ. I have used one extensively with both a KPC-3 as well as the MFJ-1270b. Hope this helps.

David,

As far as I know the SDK/DDK must be purchased directly from MS or
ordered through your dealer. It's a rare shop that stocks it.

You can also subscribe to the Microsoft Developer Network (MSDN).
Depending on how much money you have you can really go all out.
The minimum to get SDK/DDK is MSDN Professional (formerly level 2).
There are now four levels, ranging in price from $300 to $1999.

My friends and I have been discussing the issue for some time now. I
am a MSDN L2 subscriber but I have not taken on the task of learning
the in's and out's of driver development. I believe that an
installable network adapter driver could be coded with the DDK to
encapsulate AX.25/Kiss which could be bound to a COM port and pass the
IP traffic back up to NT's TCP/IP layer. I'm not sure whether one
would call a protocol driver or an adapter driver. In either case it
would have to run in kernel-mode, so would require the DDK. WA6EGJ
has analyzed KISS and says it's identical to SLIP, so it looks like we
won't have to reinvent the wheel there. This means we could bind
AX.25 into the RAS/DUN WAN Wrapper and configure the COM port to speak
SLIP to the TNC running KISS. I also believe that it'll take the DDK
to do it, I don't think VC++ 4.x or 5.0 will do it. There are
techniques to create DD's in the VC environment but debug them in the
DDK.

2012. Re: Regarding Packet Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-12 00:00:00 UTC
From: Jim Wagner <wagnerj@proaxis.com>
Message-ID: <33507DDC.4BBB@proaxis.com>
Source record: 30620

A word of explanation about TNCs - they are a lot more than a modem. They include a modem, but also have a microprocessor which does several things:

1. constructs packets from outgoing text
2. converts incoming packets into text
3. manage "connections" including transmitter keying, error correction, and such.

There is software known as KISS which handles some of this in the computer, turning the TNC into something more nearly like a modem. To use this, the TNC must also be cabable of KISS and must be put into KISS mode. KISS software interfaces are available for both PCs and Macs and are most often associated with tcp/ip or node software such as G8BPQ or MSYS. KISS is not something you can install between your terminal program and the serial port; it takes the proper software to make it run properly. For terminal use, that software is usually on of the tcp/ip programs such as JNOS, TNOS, etc.

This may be as clear as mud. If I can answer any further questions, I'd be happy to try. It might help knowning what sort of radio it is. Some of the radios with computer interfaces do not have modems but use that to do things like control frequency.

Jim, KA7EHK - Corvallis, OR

Entry level is kinda expensive. I will have to consider it, though.
Although this is making Linux look more appealing (I like Linux, but I
also like NT and NT has more commercial software).

Thanks for the info,

>non-qso medium. In many areas, it has become this. Wish it was not so!

Interesting... Over here in the Netherlands there still is a lot of
QSO activity, both via the nodes and as direct contacts.
There are chats between connected AX.25 users, and also telnet sessions
that are connected all-day between friends who exchange maybe one or two
lines of text each day.
However, for a newcomer it will always take some time to get introduced
and participate in such QSOs. Just as it always was on phone, BTW.

Then there are the conference nodes, where everyone just babbles away.
It should be easy to get going on those, especially when you are not
after meaningful conversation.

Don't be a baby! If you shop around a bit and if you knew anything about HRO
you would know the following:

1. In most cases HRO will give you the same price as anyone else. Just tell them
who has it for the lower price and they will come down to that price.

2. They charge shipping for any order under $100.00.

If you don't do your homework when you are ordering, than don't cry when
you don't have a clue what the final price is. All ypu had to do was ask what
the total was. If you don't like the price, SEND THE ITEM BACK!!!

Windows CE is an embedded operating system. (similar to the
OS/9's and the vxworks of the world) It's first application is
the Handheld PC's. It is also going to appear in settop boxes, smart
phones, ect. It is not "PC centric" in that it runs on RISC
processors, currently, although it will be running on embedded x86
CPUs in the future (not PC look alikes), as well as a couple of other
RISC CPUs. It is not Windows 95, or Windows NT. It is a completely
new kerenl with the WIN32 API. pretty powerful, since there is alot
of WIN32 developers out there.

Anyway, to answer the first person asking the question: I am currently
working on a packet program for Windows CE in my spare time. To
distribute it, I need to get permission of my employer, since we do
Windows CE development as a business, and
I have to make sure there isn't licensing, Intellectual Property

conflicts, ect. I should have something done by June. The reason is that I spend 14 hours a day doing this stuff for commercial reasons. You get pretty tired after that. I could convince my employer that it could be a product, but then the ham community would have to pay. I'd rather make it shareware/freeware.

I'll let you know how it goes.

>David L Pearce

David,

I had a working prototype of this. Unfortunately, the IP stack that comes with NT is not very wireless friendly. (Very strict about acks, ect). Unless you are doing 14,400 or higher, I would not recommend this approach. I have successfully done a 19,200 link with the driver. However, I actually made a commercial product based on my design for a commercial wireless network, so the Intellectual Property is now encumbered, so I can't give you the source to start with. But you will need:

VC++ 4.0
NT SDK
NT DDK

You'll find that satisfying the overhead of a NDIS driver is more work that actually handling KISS packets. (Initing the drivers, ect).

KISS is just enough different from SLIP that you can't use the NT SLIP support to talk to the KISS device. But your idea of using the WAN wrapper is a good approach. My thing did a full NDIS miniport.

However, Linux does provide some good AX.25 connectivity. You can always get a small 486, run Linux and have it on the same net as your NT box. You could use it as your gateway to the AMPRnet, and use all the software on your NT box.

>at all sure about this but it seems I've come across this while searching
>for info. Thus, my plea for infomation!

When the datarate is 200 bps, and thus the shift is 100 Hz, you will find that a standard NBFM receiver is much too wide and probably not well suited for the purpose.
You will need some receiver that can do FSK with narrow filters.

MSK is just a form of coherent FSK with a shift of half the datarate.
(also sometimes written as 90 degree phase change per bit)

As others have already written, you can demodulate it as an FSK signal with some loss of performance.

Hello:

I have the following items that I no longer need and are gathering
dust around the house:

1) Borland Turbo C++ For DOS v 3.0: This is a complete install on BOTH
3.5" and 5.25" HD disks
and comes with the full documentation (a VERY big book!).
While this will NOT compile
NOS without some major changes to the source code, it can
compile many other programs
and be used by someone who wants to learn C or C++
programming. Has a very nice DOS
developer's environment.

Sells new for $90.00

Your price: $45.00 obo

2) Borland C++ For Windows, DOS, and Win32 v 4.51: This is a complete
install on 28 (!) 3.5"
HD disks. Fixes a very minor bug in v 4.50 (I never saw it
come up!). Must be FULLY
installed to the hard drive (needs almost 100 megs). Is
otherwise identical to #2
above.

Sells new for $300.00

Your Price: $65.00 obo

3) Info Magic Linux CD Set: This a VERY complete Linux package and
includes full installs for:
Red Hat 3.0.3, Slackware 3.1, Debian 1.1.4 and more. Has
XFree86, full HOWTO set, and
much, much more. This is a >6< CD-ROM set! Not that the CD
case itself is damaged, but
the CDs themselves are just fine. There are many Ham packages
(mostly packet) that run
under Linux with many more being added all the time.

Sells new for $50.00

Your Price: $35.00 obo

****
* TRADERS TAKE NOTE *
****

Those Hams wishing to trade, I am looking for the following Ham gear
(must be in good working order and complete.):

1) Any 6m FM or SSB xcvr. Tube or solid state OK.
2) Any 2m FM or SSB xcvr. Tube or solid state OK.
3) Just about any packet gear... TNCs, radios, what-ever. I am
especially looking for an SCC
type card.
4) Any 2m hand held with good battery.
5) Let me know what you have! Please note that I have no interest in
HF gear.

****
* SPECIAL NOTES *
****

1) Due to export restrictions, the above may be sold only to US
citizens and shipped only to US
addresses.
2) All prices include shipping by my choice of carriers.
3) I prefer to sell as a package and package offers will take
precidence.
4) I prefer to trade the items and trade offers will take precidece.

If interested in any of the above items, please contact me via packet
or E-Mail at the addresses below. Please include your name, packet
and/or E-Mail adresses, phone number(s) and hours I can contact you.

Thanks!

Take Care & 73

2025. Re: Model 100 on packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-14 00:00:00 UTC
From: n8blk@aol.com
Message-ID: <19970414031101.XAA12403@ladder01.news.aol.com>
Source record: 30633

In article <5ir8ag$7fr$1@sloth.swcp.com>, n5zgt@swcp.comXX (Brian Mileshosky, N5ZGT) writes:

>Can somebody please post the codes needed to make the Model 100
>operate at 1200 baud, 2400 baud, etc.?
> Thanks!
>73,
>Brian, N5ZGT
>
>

I have no idea where my manual is, but using the telcom program or a program that accesses the serial port in the same manner.

They are

Stat 37I1E would give 300 baud 7bits, Ignore parity, 1 stop, enable
Stat 47I1E 600 baud, 7 bits, Ignore Parity, 1 stop bit, enable
Stat 57I1E 1200 baud, 7bits ^^
Stat 67I1E 2400 baud, see above
Stat 77I1E 4800 baud
Stat 87I1E 9600 baud
Stat 97I1E 19200

You can of course try Stat 58N1E, which would give you 1200 baud, 8 bits, No Parity, 1 Stop bit, enabled, but as I recall, that offered nothing over the 7 bits, ignore parity and had problems when using some of the programs which were written to use xmodem, either crc or checksum. However, substituting 8 bits didn't cause problems running most normal TNC's or multimodes as I recall. I only keep my Model 100 now as something to use in case of an emergency. I don't need to charge batteries for it, and it will run 20 hours on a set of four alkaline batteries, or longer with a backup 6 volt battery, which can also power a TNC like the KPC-3. Not the best setup in the world, but certainly usable for most ham needs. -art clemons-

Message-ID: <5ist6i$lf9@infa.central.susx.ac.uk>
Source record: 30635

Hi all. Not strictly an amateur "Ham" radio posting, I know, but does anyone know if there is any shareware software (or even freeware!) around for decoding aircraft ACARS transmissions? The ones I refer to are those on VHF. I would imagine the interface used for JVFAX / HAMCOMM etc would provide suitable signals to the PC and maybe someone, somewhere has written some software to decode them.

Any help / pointers would be appreciated.

Thanks,

Peter G4BVH

2028. DSP232 Modem, BPQ & FBB

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-14 00:00:00 UTC
From: cobbg@orion.sk.sympatico.CA
Message-ID: <199704141057.EAA04123@wombat.sk.sympatico.ca>
Source record: 30636

I am trying to get a DSP232 modem to run in KISS mode with BPQ and FBB. The ultimate objective is to add a HF port onto VE5RRG, our local BBS.

When running BPQ, and FBB with the DSP232, I cannot get it to work with compressed FBB forwarding. I get the error "checksum error (checsum of message is wrong)". If I turn compressed forwarding off, it will work but that is not a good long term solution. I have tried the various KISS "extended options" available with the DSP232 and BPQ with less success. I get a connect, but no data transfer occurring. Eventually it times out.
Note: 1) When I put my old KAM back on line instead of the DSP232, compressed forwarding works just as it should.
2) DSP232 has Nov 96 EPROM version 1.0b, BPQ is 4.08, FBB is 5.15c.

Does anybody have experience with getting the DSP232 to work with BPQ and FBB? I would sure like to hear your secret.

2031. 9600 bps Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-14 00:00:00 UTC
From: Carl Morgan <MorganCL@MUohio.EDU>
Message-ID: <33525870.725@MUohio.EDU>
Source record: 30639

I am asking for thoughts, insights, and good counsel into running 9600 bps packet on 2M.

Any experiences in using commercial gear; i.e. Motorola, GE, Aerotron, etc. for the TX/RX? If so, what were your experiences regarding required modifications?

I'm planning to use a KPC-9612 and impliment both 1200 and 9600 on the same frequency and with the same radio equipment.

Your counsel will be appreciated. Please e-mail to MorganCL@MUohio.edu

Thanks <> 73 >< Carl, K8CM

>both have computer interfaces available, what makes this deal
>attractive?

The difference is that the 38 and II, like most hand-held GPS units,
have no one-pulse-per-second (1PPS) output. The time is available
in the NMEA data stream, but is only accurate to within one second.
That's good enough for setting your computer clock for most purposes,
but not anything that requires relatively precise time.

For time/frequency measurements, you need the 1PPS output, and that is
mainly available from board-level GPS engines. This output is synchronized
to the beginning of each UTC second with an accuracy of 1 microsecond
(GPS-20) or better, a factor of 1 million better accuracy than the NMEA
output of a handheld GPS. The Encore is another factor of 20 or so
better than the GPS-20.

TAPR is selling both the Garmin GPS-20 and the Encore, so you can make
your own tradeoff between cost and accuracy.

(The Trimble Scoutmaster is a handheld receiver that (optionally) has a
1PPS output, but I think you'll find it more expensive than the Encore
board.)

2033. Re: Model 100 on packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-14 00:00:00 UTC
From: k5qq@aol.com
Message-ID: <19970414170301.NAA20577@ladder01.news.aol.com>
Source record: 30641

Hi Brian
The codes for the RS100 are (Following pushing Telcon and Stat)

Baudrate
Wordlength
Parity
StopBits
Line Status
Pulse rate(must be prefaced by a comma)

Baudrates (of interest):
5 = 1200
6 = 2400
7 = 4800
8 = 9600

Word Length: is usually 8 for all the stuff we do

Parity:
I = Ignore
O = Odd
E = Even
N = No Parity

StopBits are usually 1 for the stuff we do

Line Status:
E = Enabled (XON)
D = Disabled (XOFF)

Pulse Rate: Note this is for their modem to dial out
10 = 10 pps
20 = 20 pps

Good luck

Q

AFAIK there are currently no shareware or freeware ACARS dcoders.
There are at least two projects to use a soundcard and these are both
aiming to be shareware.

!FLEXNET GOES WINDOWS 95!
=========================

NEWSFLASH * NEWSFLASH * NEWSFLASH * NEWSFLASH * NEWSFLASH * NEWSFLASH *
NEWSFLAS

This message announces the availability of PC/FlexNet for Windows 95.
The
package features full driver support for almost the complete set of
amateur packet radio modem hardware.

- - BayCom 1200 Baud serial port modem fully supported.

- - BayCom 9600 Baud parallel port modem fully supported.

- - Soundmodem drivers by Thomas Sailer.

- - network protocols IPX and AXIP supported through WinSock32

AND THE HOT NEWS NOW:
---------------------
AX.25 network driver for the WinSock32 TCP/IP stack!
Forget TFSLIP and related "tricks", FlexNet provides the
REAL AX.25-to-TCP/IP SOLUTION!

PC/FlexNet for Developers:
- --------------------------
PC/FlexNet truly is an open system: It features an easy to use
programming
interface called FLXAPI, available for 16Bit DOS environments AND for
WIN32
(FLXAPI32)! Modem hardware is accessed through the FLXDRV interface.

Development kits for FLXAPI and FLXDRV are available!

* CHECK OUR WWW PAGES NOW! *

Hello all

Due to business and personal commitments, I can no longer maintain and grow the Aussie Winpack Page. I have moved from Sydney to Perth (vk2 -> vk6) and can no longer justify paying the ISP costs when I can't get access to it !

Its been a lot of fun over the last 2 years, in total I think the pages have over 30,000 hits. The links to the pages are growing daily and it is unfortunate that I have to close them.

There are now a number of other web sites carrying the servers and I see that G4IDE has his own web page. If you read packet bullitens, there are also a number of CLOWNS broadcasting 8kb packet messages telling you about their pages, bit of an ego trip I think !!

Thanks to Mick in the UK for his support with lots of software and also thanks to Ken, the Taranaki terror for most of the tpk stuff.

If anyone wants to carry on with the page in its format, varied format or anything else, please take the files and use them......

Cheers..Pete..vk2yx

2039. Control FT-890 (TTL levels) from Mac?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-14 00:00:00 UTC
From: kwick@mitre.org
Message-ID: <kwick-1404971758080001@wickwire1.mitre.org>
Source record: 30647

I have one of those TTL-to-RS232 level converters that are
sold (mainly to PC owners) to allow control of rigs (in this
case a Yaesu FT-890 with comm parameters: 4800/8/N/2 stopbits).
The converter's built into a DB25 connector. When a PC does
the control, CTS and DTR go high and things work (with occasional
crashes) with a PC radio-control program from MFJ.

I think the adapter gets power (or at least gets turned on)
from the PC's DTR line (pin 20 on a DB25).

I've written Mac ThinkC code to control the 890. Attempts to
run it through the adaptor from the Mac serial and modem ports
by sending strings of characters with toolbox calls and reading
the port for a response have displayed nothing. What's supposed
to come back is various strings of control characters, which my
code would display in %x (hex) format.

I tried putting +9 VDC on pin 20 (DTR) or on 20 and pin 5 (CTS)
on the adapter side with minus to signal ground: still no dice.
I haven't tried controlling the radio directly without the adapter;
that would require a minidin 6, which is hard to find.

Anybody talked to TTL level rigs with the Mac? Do I need the
adapter? Do I not want it? Any suggestions?

Thanks Ken KB1JY kwick@mitre.org

Source record: 30648

If the radio has RS-232 i/o, you do NOT need the adapter.

Be sure that you use the negative input and output pins from the Mac serial port. I use Mac with serial all the time, and no adapter is needed with RS-232 devices.

Hi Folks:

I'm a new ham (so new in fact that I don't have my call yet! Test was on Saturday.), and unfortunately for my wife's checkbook, there was a hamfest last Sunday. Since I have been interested in packet, I picked up an NEC 8201A, which I'm told is quite similar to the TRS-80 Model 100. My question is, can anyone tell me, step-by-step, how to use this it for packet? I understand that I need a TNC, and other posts here have said that the resident terminal program will be sufficient to run it. But what parameters do I set on the computer? How do I do it? Which buttons do I press?
Any help at all will be greatly appreciated, and I thank you all for your time.

Matt

Well for the 1200 baud stuff the KPC-3 or KPC-3Plus is the way
to go. Small unit and good software availability. The KPC-3
should still be available through most of the radio dealers
and will be a little cheaper than the 3Plus.

What makes the Kantronics appealing over the MFJ is the
host mode interface. There are several software packages available
that utilize this approach and it makes a much cleaner interface
for the user.

Message-ID: <33538804.1CA2@worldnet.att.net>
Source record: 30656

Anyone know where a comprehensive article can be found that defines the Emmission type that the FCC would require for logbook entries?

For example: Is CW acceptable or must it be A1A for on/off keying ?

What about AFSK for Baudot RTTY? Is it F1E or J2B ???

I admit that I am confused. Rather than concentrate on that bit of confession, please help if possible.

Im looking for information about all authorized modes of emmission by radio amateurs, not just the "digital modes".

A pointer to specific part of FCC Rules and Regs Part 97 would be helpful.

Thanks es 73s,

Vince

Source record: 30658

In article <33538804.1CA2@worldnet.att.net>, Vince
<WA2RSX@worldnet.att.net> writes about a lot of US specific stuff that I
can't comment on. However:

> What about AFSK for Baudot RTTY? Is it F1E or J2B ???

Baudot RTTY can't be <anything>E. The third character must be B - it's
automatic reception telegraphy, not telephony, which is E. If it's FSK,
the second character is 1 (defined as a single channel containing...
digital information *without* the use of a modulating sub carrier -
there's no sub carrier as FSK is frequency shifting the carrier). AFSK,
by definition, has an AF modulating sub carrier, so the second character
must be 2.

Baudot RTTY (or indeed any RTTY or AMTOR) is listed in the UK licence
as:
F1B Direct frequency shift keying of the carrier (FSK)
J2B Frequency shift keyed audio tone on a SSB transmitter (SSB AFSK)
F2B Frequency shift keyed audio tone on a FM transmitter (FM AFSK)

I hope this helps.

John, KB0OLD@KA0GZN.#SECO.CO.USA.NOAM signed a message from
Robb (drobb@csn.NET) which said:

: Hi. I have seen several network games for landline use. My question is if
: any of those games can be used on the tcp/ip amateur network, or if anybody
: has designed their own tcp/ip games for amateur radio. I'd appreciate any
: feedback. Thanks.

We have experimented a little with the Winsock games over our tcp/ip
radio network. We've tried WinChess and also various 2way audio like
IGP, Internet Phone and such.
Basically they all seem to run pretty well since they are for the most
part designed to operate over a lanline and we have more bandwidth than
that (~6 kbytes/sec over a two hop RF path running IP).
I personally think that the better 'game' is that of designing games
but the kinds of things we've tried have been more along the line of
remote test equipment access and control and that sort of thing than it
has been traditional two player games.
I'd be interested if you come up with a game or an idea for a game that
uses some aspect of the players geographical separation as an essential
part. Just playing over radio a game that could just as well be played from
the next room doesn't seem to have the fundamental attraction to it that
a real "amateur radio" game might. I suppose that APRS might be catagorized
as an amateur game. Are there others?

On the Tx-Rx unit (the back board with the final modules on it) closest
to the battery (bottom of the rig) is a very small trimmer cap (TC1).
This adjusts the master reference oscillator.

That should be all it takes.

Thanks Dave for your input.

Interestingly, the FT1000/D Operating Manual lists the following under Emission modes (I believe these designations correlate to the MODE select buttons on this radio, rather than Government/radio emission designations defined within rules and regs):

LSB/USB (J3E),
CW (A1A),
FSK (J1D, J2D),
AM (A3E),
and FM (F3E).

I use an AFSK modem (XR2206 & XR2211 chipset) here for HF Baudot RTTY. I select the LSB mode on my radio. I have been entering J2B in my logsheets, but I wondered if I should be using J3E or J1E ? After reading your information, I am convinced that J2B is correct for my situation.

If and when I obtain a PK232/KAM-Plus TNC, I will have a very similiar question. I understand that in the FT1000/d, indeed the other modern radios as well, a uP-driven internal AFSK generator is used, and the tone generator is indirectly controlled/keyed by the TNC's Tx Data signal waveform when using Baudot/FSK. Does this mean that J1D is incorrect for logging data?

I wonder if Kenwood, Icom, Ten-Tec, et. al., use the same designations for emission modes/radio mode selections? This 51.6 pound Yaesu black box is my first solid-state radio, so I am unaware of the designations of other manufacturers. Some radios have buttons labelled RTTY others use FSK.

Information found within the ARRL 1987 Radio Handbook is less than crystal clear, IMHO.
Time for me to upgrade my library, I suppose. Would like to read about this topic on the Internet rather than changing/increasing the paper documents in my radio shack.

73s es tnx again, Dave, OM.

It is on the B/7 board, left to the Battery Terminal. Don't mistake it
for a Helical adjustment which is situated to the left, above the
DC-IN jack.

Hope it helps.

>Does anyone have any experience connecting this type
>of rig to higher speed TNC's???

I've been experimenting with converting a Mitrek to 19.2 using the +/-10kHz FSK keying that the Kantronics D4-10 radio uses. Getting that much deviation requires hammering an unmodified TX channel element with about 12 volts of low impedance TX data, but it does work.

The RX is much more of a challenge -- the stock filters are barely adequate for 9600, and I haven't had any luck finding 60kHz 10.7MHz crystal filters to use as replacements. I'm working on some alternatives, but no success to report yet. The good news is that if you can get a signal through the IF, the discriminator seems to be wide enough to handle the FSK without any problems.

And, the turnaround time isn't too bad -- the reed antenna relay is very fast. There is a delay circuit in the TX, though, that you'll need to mess with. I haven't measured, but you should be able to get away with TXDs of 30ms or so; that's not ideal, but still workable.

Now, if you're looking at doing 19.2 using G3RUH style modems, the job should be easier -- there, you only need 6kHz deviation, and the Mitrek TX will do that easily. On the RX side, you'll want 30kHz or so and it may be possible to find filters to manage that -- unfortunately, the filters that retrofit into the TEKK radios for 19.2 are at 21.4 MHz, so they won't work.

If you pursue this project, please let me know your outcome -- I'm very interested in comparing notes.

>>
>>I need help in which TNC to buy. I want to work 2 meters (1200) baud VHF
>>packet only. I have the Baycom but now want a true TNC.

Buying a TNC is always a compromise. One should tend to purchase a
plug-in packet interface card because they are superior to TNCs.
With a TNC in raw ax25 you don't conquer the world. Only when you
install a true networking software are you able to go out further than
your own courtyard:-) But then all of the neat features of a TNC are
discarded because usually you put it in a Keep It Simple Stupid Mode.

Since not long ago your baycom is a perfect device to be used both
under Linux and Windoes 95 Operating System.
With Flexnet Package you can use all of the Internet Programs you've
been using so far with baycom and TCP/IP over AX25!!!!! All under
windows 95.

It is a very good news.

2065. Shareware US Callbook available

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-16 00:00:00 UTC
From: n7ln@qsl.net
Message-ID: <5j3g1s$rnd@esnews.corp.es.com>
Source record: 30523
Cross-posted to:
rec.radio.amateur.policy,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.dx

I have recently released my Shareware Callbook for distribution. It
is a complete and fully functional US Callbook that runs on any PC.
(386 may take up to a minute to find a call, 486 and higher 10-15 seconds.)

The callbook is updated up thru February 24, 1997 and includes many
of the recently released vanity calls. The callbook includes calls, names,
and addresses only. It is 24 megabytes to download and takes up 61 megabytes
on your hard disk.

Visit my website for more information: http://www.qsl.net/n7ln/callbook.html
or ftp it directly from ftp.qsl.net in the /pub/n7ln directory. Registration
is only $10. Read the file CALLBOOK.TXT first.

Come check it out!

>- - Soundmodem drivers by Thomas Sailer.

Why does Flexnet only support hardware developed by the Baycom group, and then call that "support for almost the complete set of amateur packet radio modem hardware"?

I really fail to see why it (for example) supports the Baycom USCC, but *not* the SCC cards developed by other companies and groups. Is this protectionism ever going to go away?

Some of us live in such rich RF environments that 1200 baud at 70cm is
dicey. Cellular towers field the horizon and telephone microwaves warm
our brains. Must be nice living in the country.. ;-|

Isn't it great living in America?

```
I have located a used Trimble TDC-1 GPS.
I have a Tiny-2 PacComm TNC with some older EPROM like 1.1.3 or 1.1.4.
Does anyone have experience in using a lashup like this or should
I just let the GPS go and not get involved?
The reason I have this question is the operational manual is missing
for the Trimble TDC-1 but I did see it work and it is much more
useful to me than other common units when it comes to interfacing.
Can anyone help me please?
E-mail me direct with responses.
Thank you

Hi Jeff!

It's not the baud rate, per se, its the link latency. You can run the IP stack over slow landline modem connections without a problem. But if you run it over a 1200 baud simplex wireless link with line turn-arounds, TxD/RxD delays, channel contention, etc, I suspect you exceed the timeout (latency) parameters as the protocol stack assumes wireline channel characteristics.

At least that seems like a reasonable theory to explain why the TCP/IP stack in NT (its exactly the same one running in Windows 95 too) can run over a slow landline modem link but not a comparably slow wireless link.

You are correct Ed. That is the problem. So I just need proactive
acking and VJ's sliding window algorithm and we are all set. Got any
influence with the powers that be? :-) :-)

Actually, I read the White paper on the stack, and there are registry
params you can set on NT. I might fiddle with those and see what
happens.

GE Master II radio's work great. A local bbs here runs 1200/9600 baud
with a 9612 tnc.
One thing you want to make sure of is that you sweep tune the rx.

Timewave has recently acquired the AEA data and software product lines. We have an ACARs package. Details are in the 1996 AEA catalog. We can give you details at (612) 452-5939. Check our web site (http://www.timewave.com) for additional AEA information. In is being updated frequently.

You may want to consider the PK-12. Timewave has recently acquired the AEA product line. The PK-12 has a suggested list of $99.00. It comes with bundled software or can be used with other programs.

2082. Hamcomm interface programming?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-17 00:00:00 UTC
From: "Joseph C. Bender" <jcbender@oakland.edu>
Message-ID: <Pine.OSF.3.95.970417102625.15595A-100000@saturn.acs.oakland.edu>
Source record: 30540

I am currently in the process of developing a low-cost TTY/TTD for the hearing impaired community, and I have had experience operating with hamcomm and it's associated interface, so I've decided to use the hardware as the interface for my project, as a standard TTY/TDD uses 45 baud Baudot for a protocol.

The thing is, I cannot find ANY information about programming software for use with it.

If anybody could drop me a line with any information about programming information, in terms of URLs, source code in C/C++ or contact E-mail addresses, I'd really appreciate it.

2083. Decoding FSK RF signals as Audio tones?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-17 00:00:00 UTC
From: Alec Muffett <alec.muffett@uk.sun.com>
Message-ID: <nd3enc9bq6n.fsf@uk.sun.com>
Source record: 30541

I've been considering how to do software digital data en/decoding, and thought I'd experiment with 1200 baud POCSAG for starters, since it's so common.

I've read around the topic and seen the specifications which refer to there being a "+/-4.5KHz shift" to indicate 1's and 0's respectively, but coming at it from the point of view of someone with a VHF receiver, a soundblaster card and a Linux PC, that's not very useful to me.

What I *do* hear is an audio tone; sampling a POCSAG datastram at 44000 samples/second yields what appears to be a a nice smooth 300Hz tone (frequency determined by counting samples) lasting nearly two seconds, and then a complex audio signal.

I suppose that the pure 300Hz tone corresponds to the 576bit POCSAG preamble and that the blast of noise which follows corresponds to the rest of the message, and is caused by some pure carrier tone being RF-modulated by +/- 4.5KHz; since I look at the signal with a fixed frequency I suppose I hear this as modulation of the audio tone by some different amount.

I am new to this, so I'm wondering: am I correct at all?

My brain is having problems trying to find an explanation relating the burst of pure 300Hz tone (etc) to the documented "4.5KHz carrier shift" - of what carrier? audio? rf? - encoding the 576bit preamble:

1010101010101010...

The obvious approach to decoding (from my point of view) to me would be to FFT the audio signal 1200 (maybe 2400?) times per second and try to determine whether I am receiving a 1 or a 0, but I am not at all certain that this is the right approach; again, I am uncertain because of the disjoint between what I hear (audio tones) and what's documented.

I don't suppose anyone could suggest any hints/pointers?
They would be very gratefully received...

Thanks,
- alec

ps: I already *know* there are POCSAG decoders and similar stuff for DOS available "out there" (PD2.03, Semasoft, etc), but I'm not interested so much in the data as in the problem of decoding digital data from audio, so they're not much help.

Once I get it sorted, I want to write a low-bandwidth audio networking protocol, along the lines of Psion's "frog" comms.

Terminal software is available for the HP48G(X) calculator. It is
smaller than any palmtop that I have seen and the battery life is
incredible. I probably would not use it for packet if something larger was
available.

From: Vince <WA2RSX@worldnet.att.net>
Message-ID: <335678AA.74B5@worldnet.att.net>
Source record: 30548

Joe:

The HamComm software provides for selection of any set of tone pair by editing the HC.CFG file, if you want it as a more permanent change from the default. Selection of tone-frequencies and baud rate is selectable from within the program also.

Having said that, if I recall correctly, the tone frequencies required for TTY devices are 1200 and 1600 . I am not absolutely certain of this, but will try to locate my notes. I was looking into use of the HamComm program for a Voice-Carry-Over text telephone. We are using a ULTRATEC INC Uniphone 1200 unit. In my case, I was not interested in receiving AFSK from the text VCO device; only transmitting from my end. I never completed the project of building a suitable interface for coupling the AFSK tones from Ham Comm to the telephone line, so we are still going through a relay operator.

I think the primary key is to determine the tones and baud rate required required by your TDD and then simply setup HamComm for the software-driven modem functions. Secondly, you will need to interface to the telephone line in a safe and proper manner.

I dont believe programming in C++ is necessary.

Good luck/73s,
Vince

2091. Palmsize APRS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-17 00:00:00 UTC
From: Patrick Cook <patcook@dimensional.com>
Message-ID: <Pine.SUN.3.95.970417212205.14875J-100000@nova.dimensional.com>
Source record: 30549

Hello fellow hams:

I'm a newbie to the newsgroup, so please forgive this possible FAQ, but has anyone ever tried running APRS on one of those pocket, palmsize computers??? If so, other than it computer interactive, what other requirements are there (besides a suitable transceiver and possibly a TNC)??

Reason I ask is one of our local clubs just had a rather impressive demonstration as the meeting program, even though the video part wasn't in real-time in the live sense and I read in the ARRL handbook that one can put together a complete APRS station and stuff it into a cigar box, making it suitable for bicycle mobile operation.

A friend of mine, Larry, KB0ZEQ, came up with the concept during his comments. I can only assume he wasn't nearly as impressed as I was.

Any comments (non-flammatory, please :)) would be useful to this relative packet newbie. :-)

73's for now my friends!! :-)

Well, I've got hamcomm set up for it, but the reason why I was
asking is that HC is hard to set up for that particular purpose. In fact,
I have it running sucessfully. I'd just like write a dedicated program
for the purpose, and make it freeware to the community at large, so that
people have a low cost alternative to such things.

Accoustic coupling works fine. BTW the center tone is 1600 Hz and
the M/S tones are 1800 and 1400, so that work out to a 200 Hz shift off
center. That is current american standard. There is SOME 300 baud ascii
work, but I'm not too sure if the tones are the same. 45 Baudot is mostly
the default.

> I think the primary key is to determine the tones and baud rate required
> required by your TDD and then simply setup HamComm for the

>
Again, I have it cheaply accoustically coupled using a junked set
of headphone transducers, and a LM386 IC as a preamp for the input. Not
hard, if you can stand the chatter of the TTY tones. BUT I consider using
hamcomm a kludge in this matter, and would like to have a dediciated
program, similar to UNIX "talk". The reason I was asking about it is
beause I'd rather use established libraries and whatnot, other than
possibly generate buggy code to do hardware calls.

Surely that is Skyview systems old ACARS package (Lowe Airmaster to
most people). Admittedly the AEA manual was better than Lowes but the
Lowe software is at V3 and is considerably better than the AEA ACARS (
equivalent to Airmaster V1).

The question was about shareware or freeware, Al. Are timewave going
to give it away (AEA didn't).

From: slug@bbs.aeminium.pt
Message-ID: <5j5fmt$nl2@pc2.local.aeminium.pt>
Source record: 30555

Hello

Me and a bunch of radio-amateur are thinking of making some experiments on high rate data transmition and we would like to try the uwave project that was designed by N6GN and N6RCE .
We live at Coimbra, center Portugal, South-West Europe so could you tell me were could i get some of the components (Portugal or Europe would be great)

The main problematic components i think will be:

- the 2nf IF 45 MHz (SRA-1 Mixer)
- the Gunn diode & the Mixer Diode
- MAR-6, MC13055 & MC10116 (i think i can get them...)

If any of you has built this project , how much did it cost?

I was thinking of connecting the TX and RX to the 10baseT wire of a NE2000 card? What do you think about it?
This would be a very good solution to me since i'm running Linux and a baycom modem (1K2) on a 386DX40 (moving to a DX100 soon) and TCP/IP would be great.

Reply's by mail would be more aprecciated since my main USENET server has a very low expire time and sometimes i miss some of the articles.

You can reply to slug@cygnus.ci.uc.pt , slug@student.dei.uc.pt or to slug@student.dee.uc.pt

Thank you very much!

If you dont know about AGW series of packet programs for WIN95 visit my site for more info and downloads. The Url is http://www.forthnet.gr/sv2agw/

1.Now AGWBBS.EXE and AGWFWD.EXE support HTML format messages.The whole operation is auto.AGWFWD when downloads a message scans it for html format.Then the AGWBBS when responds to a read command if the message is html launces your web browser.No need for special titles etc.So simple.
2.AGWPE now has self adjust packet parameters.Auto adjust maxframe,persist,slottime,frack,resp etc depending on channel traffic and link quality.

We have the following CD-R media and CD-Recorders for Sale:

Brand: Pioneer
Type: Printable Media (Surface of cd is blank for printing or labels)
Type: Gold on Green
Size: 74 min (650 mb)
Price: $ 5.00
Packaging: Jewel Case
Minimum Order: 10

Brand: Maxell
Type: Gold on Gold
Size: 74 min (650 mb)
Price: $ 5.00
Packaging: Jewel Case
Minimum Order: 10

Brand: Maxell
Type: Unbranded (CD and Jewel Case is blank with no name on it)
Size: 74 Min (650 mb)
Price: $ 5.00
Packaging: Jewel Case
Minimum Order: 10

Brand: Maxell
Type: Unbranded (CD is blank with no name on it)
Size: 74 Min (650 mb)
Price: $ 4.75
Packaging: Spindled
Minimum Order: 50

Brand: TDK (IEC Nippon)
Type: Gold on Green
Size: 74 min (650 mb)
Price: $ 5.00
Packaging: Jewel Case
Minimum Order: 10

Brand: TDK
Type: Gold on Green
Type: Unbranded (CD is blank with no name on it)
Size: 74 Min (650 mb)
Price: $ 4.75
Packaging: Spindled
Minimum Order: 50

CD-Recorders

Brand: Yamaha
Speed: 4 Write X 4 Read (4 X 4)
Version: CD-R 100 Internal Version
Software: Gear 4.0
SCSI Card: Adaptec
Comes complete with All Cables and Software need for Installation.
Media: 5 Pieces of your choice
Price: $ 999.99 US

Please take note that our phone number as changed from (213) 650-1680 to: (714)-461-5150

Source record: 30562

Well, Rob:

It`s the same thing all the time: If you need a driver for a special brand
of hardware, you need to urge someone to do the greasy, dirty thing:
writing the driver.

Listen then: PC/FlexNet supports any hardware if a driver exists. The fact
that certain kind of hardware isn`t supported yet has nothing to do with
protectionism. Software does not fall from trees - you should know that.

Listen further: If you want a special kind of modem or SCC adapter to be
supported, find someone to write a driver, make him/her to request the DDK
for PC/FlexNet and you will (hopefully) have a driver in a few weeks.
Even better: As you are a skilled programmer, do-it-yourself!

Maybe you haven`t noticed yet that FlexNet is not a commercial project and
that all the work is done in the spare time of the authors. I for myself
refuse to do boring things in my spare time, and writing a driver for an
SCC card is boring. I don`t own one, I don`t need one, I don`t need a
driver for one. Got the point?

almost is a "rubber" expression. Maybe I said "almost" because I thought
it was funky to say "almost" there and more correct than saying "all", who
knows...

regards, Matthias.

The RF carrier is shifting. Of course, when you listen to that with
an FM receiver, you will hear audio 'tones' when the shifting pattern
is regular, like in the preamble.
During the data transmission there will be a "random" sound.

>The obvious approach to decoding (from my point of view) to me would
>be to FFT the audio signal 1200 (maybe 2400?) times per second and try
>to determine whether I am receiving a 1 or a 0, but I am not at all
>certain that this is the right approach; again, I am uncertain because
>of the disjoint between what I hear (audio tones) and what's documented.

You should not FFT the audio, because you should not be looking for tones.
Just sample the audio and determine if it is above/below a threshold
to determine if it is a one or a zero.
(which level is the one and which is the zero can be automatically
determined by looking for the syncword in both polarities, and remembering

the correct polarity once you have detected a syncword. this can be done for each individual transmission, in case you want to listen on different frequencies and your receiver might invert the signal on some bands)

I have done it myself, but I have tapped the audio directly from the discriminator. Using the loudspeaker audio will cause problems, because the spectrum of FM-demodulated POCSAG data starts at very low frequencies (the data is NRZ and there can be quite long runs of zeroes in the data)

It is a nice project to undertake, and will learn you how to filter the input, make an appropriate 1/0 decision, and a clock recovery (= decision when to optimally sample the input). I implemented it on a 56001 DSP card with postprocessing on a Linux system, but it could be done on Linux alone.

Hi there!

I am making some research to wirte a packet program together with some
other Hams.We can see
in the ax.25 documentatition the use of the PID field, but can anyone
inform we of which are the PIDs kown or where to obtain this info?
And inside this PIDs any of them does frame ack for multiple users?
Any of them though for a (worst case) star Configuration or (best case)
star-in-ring configuration?

Thanks for your help... 73s

P.D. Please answer to my email aswell as the newsgroup. TNX!

>driver for one. Got the point?

The above does not express the situation in a very realistic way.

An SCC driver already exists for Flexnet, but it is (IMHO) artificially crippled to work only with the Baycom USCC. Other SCC cards are not supported, and when their creators or users ask for that, they are invited to write their own SCC driver from scratch using only a DDK.

This situation has existed ever since Baycom started to support an SCC card. At the time the Baycom USCC appeared, all other wellknown SCC cards (PC100, DRSI, PA0HZP, etc) already existed and were being distributed including documentation about IOport mapping.
Still, the Baycom group decided to design their own SCC card, layout the IOports in a pattern incompatible with everyone else's, and hardcode their Baycom package to work only with their own USCC card's port addresses.

At that time, it seemed logical because after all the Baycom group wants to sell their hardware (this is what brings in money for their projects), and did not want to support other people's cards.

However, all the other software developers came forward and incorporated Baycom USCC support in their programs. Look at the G8BPQ node, the KA9Q NET and NOS programs, the TFPCX driver, Linux, etc.
Every time, this has not been "a greasy, dirty thing", but at most the

addition of a flag to support the unusual IOport layout and maybe the timer interrupt provided on the USCC card (the latter is not required).
Drivers with flexible configuration of IOport addresses usually had little problem with the USCC.

IMHO, the adaptation of the existing (U)SCC driver in Flexnet, assuming that it has been reasonably well coded, to other SCC cards would have been a trivial job to undertake. It is not reasonable to expect others to write a driver from scratch in this case.

Furthermore I would like to add that a PA0HZP SCC card including external modem was provided to DK7WJ for free long before PC/Flexnet appeared, I think it must have been given to him about 4 years ago on a Weinheim or Frankfurt meeting. This included programmer's documentation. It was given to him (and accepted) for development and testing of a driver.
Even if he did not write the USCC driver himself, he could have passed it on to the guy who did.
I think the non-availability of a driver for this card at least has some unpleasant smell around it.

> a soundblaster card and a Linux PC, that's not very useful to me.

I tried to post a response but had some problems. If you see a partial
message in addition to this one, ignore the other.

I wrote a program which runs under Linux to decode 512 and 1200 baud
POCSAG. You are certainly welcome to study the source code:
ftp://grover.mta.ca/pub/pocsag_a2.tar.gz
You MUST have a clean digital signal directly from the discriminator
to use this software. If you don't beleive me look at the measured signal
from the headphone jack.

The program seems to do a good job at decoding and I even implemented
the error correcting code but I don't know if that portion is up to
speed!

The program decodes the bits by watching for 'changes' in the sign. When
a transition occurs, the number of samples read since the last change is
divided by the appropriate number to see how many bits there were.
The program seems to do well on 1200 baud with a sample rate of 11025
8-bit samples per second.

On a somewhat related note. I am currently working a very high speed data
decoding of the 'forward control cannel' of a cellular system. The data
is sent at 10,000 baud and requires a sample rate of 44100 to ensure a
good measurement. Also because of the baud rate is so high, there are
a lot of harmonics present making the bit detection a little trickier than
the slow 1200 baud of POCSAG.

Right now I am detecting and decoding most words on the stream fairly
reliably but I am having difficulty getting the soundcard to continuously
load a 44.1kHz stream. It seems to take 2 or 3 seconds to set up every
time.

Unfortunately there is no "established agency" that keeps record of
these PIDs. They are essentially "free for grabs" and one can only
hope that the usage of a certain PID becomes well-known in the packet
programmers community so that someone else will not take it.
Here is a (partial?) list:

```
/* AX.25 Level 3 Protocol IDs (PIDs) */
#define PID_X25 0x01 /* CCITT X.25 PLP */
#define PID_SEGMENT 0x08 /* Segmentation fragment */
#define PID_PBP 0xbb /* AMSAT Pacsat Broadcast Protocol */
#define PID_DBP 0xbd /* AMSAT Directory Broadcast Protocol */
#define PID_TEXNET 0xc3 /* TEXNET datagram protocol */
#define PID_LQ 0xc4 /* Link quality protocol */
#define PID_APPLETALK 0xca /* Appletalk */
#define PID_APPLEARP 0xcb /* Appletalk ARP */
#define PID_IP 0xcc /* ARPA Internet Protocol */
#define PID_ARP 0xcd /* ARPA Address Resolution Protocol */
#define PID_RARP 0xce /* ARPA Reverse Address Resolution Protocol */
#define PID_FLEXNET 0xce /* FlexNet (same as RARP! only used in I-frames) */
#define PID_NETROM 0xcf /* NET/ROM */
#define PID_NO_L3 0xf0 /* No level 3 protocol */
```

>And inside this PIDs any of them does frame ack for multiple users?
>Any of them though for a (worst case) star Configuration or (best case)
>star-in-ring configuration?

PIDs are not related to that, they define the type of data carried in
an AX.25 packet. A packet is either sent on a point-to-point connection
(LAPB connection), or as broadcast data (UI packet).

They are available from both TAPR and MFJ. Paccomm also has compatible
eproms. The TAPR eproms are less expensive if you don't want a mailbox
in firmware. See http://www.tapr.org.

2120. Yaesu 757 GX and GX II Spectrum Analyser Software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-19 00:00:00 UTC
From: dthimm@unix.newnorth.net
Message-ID: <3358f79e.16037972@news.newnorth.net>
Source record: 30578

Hello Everyone.

Well, after several modifications feature additions and improvements,
I have finally completed the software and am making it available to
whoever would like it.

Some of it's new features are:

Track and Hold
Hi Speed scanning and logging
Automatic Station logging
Grapical Analysis and review
Quick "Return to" active frequency
Windows Environment
Funtional Radio Control Panel

To find out how to get a copy of this software please visit my
website at:

http://unix.newnorth.net/~dthimm
Robots, Rockets and More!"

Also, I haven't forgotten all of you with computer capable Rigs other
than Yaesu.... I am going to be working on those versions shortly,
but go ahead and take a look at this one , just run it in demo mode to

get a feel for what your rig's version will be able to do!

Thanks Again for all of your support.

Dan T.

It sounds like the battery has died in the unit. Try replacing
it. When the display is blank, this usually means that the TNC in
in the autobaud mode.

What programs have you tried with the TNC? XPWIN
or XPDUAL both should be able to initialize the TNC when it
is in this mode.

Source record: 30582

I forgot already yikes!. When in Unproto mode and you want to set
the path thru more than one digipeater, do you seperate them with
a space only or do you use a (,) as a seperator like this:
unproto Joe via ABM6US-1 ABM6AG-10 (or)

unproto Joe via abm6us-1,abm6ag-10

Maybe both will work I dunno.

2125. www.hamradio-online.com: FCC Allows High Gain Unlicensed Tx in Amateur UHF Bands

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-19 00:00:00 UTC
From: vbook@vbook.com
Message-ID: <5jbjs0$f5o$1@kanga.accessone.com>
Source record: 30583
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.policy,rec.radio.amateur.homebrew

Under terms of the Report and Order in ET Docket 96-8, released April 10, 1997, the FCC has announced that it will allow high gain antennas for unlicensed transmitters operating in the 2400 and 5800 MHz Part 15 allocations. These bands are shared with the Amateur Radio Service.

Under the new rules, very high gain antennas may be deployed at 2400 and 5800 MHz. Certain transmitter power reduction restrictions apply at 2400 MHz but unlimited gain systems may be installed at 5800 MHz. These systems will enable high speed Internet access using unlicensed systems. You can expect to see these systems deployed rapidly as soon as 1998 to provide non-commercial and commercial services on these frequencies.

The complete story, including the Report and Order, is now available online at:

With most TNC-2 based TNCs, the format is to separate the second and following digi calls with a comma from the preceeding call. Remember to list the calls in the order encountered by the packet outbound from your station.

This is actually a good thing.

First semantics, in a physics sense there is no such thing as a "gain
antenna" the best an antenna can do for you is to reshape the pattern
putting more of the energy radiated into a smaller cone.

A very high "gain" antenna directs most of the radiated energy towards
the intended receiver lessening the chance for inadvertant
interference. The long and the short of it is this order is to the hams
benefit. We will also benefit from the research and engineering that go
into these systems.

Steve... PPWIN does beautifully with it. The second version works much more
stable with OS/2-VDM sessions. To run it that way, you'll need both Ray
Gwinn's SIO or something like it, together with TAME320 as well as OS2COM
if you want to run it with multiple comm sessions.

I am told that the Australian TNC program in it's most recent form also
works well with it, but haven't tried it - even under OS/2-VDM sessions...

A native 32 bit OS2 app for OS/2 for the PK900 written by HB9CVV is a
JEWEL of a program for TNC use with OS/2. Pulse doesn't even know the
app is running most of the time. I think the correct version is THS-850
that has the right code - will run the PS900, 232 and also the PK-88
under OS/2 native..... The 900 is in one session for two channels on COM4
for my setup, my V34 BBS system is on COM3, the Internet is on COM2 for
full TCP-IP and my entire station is on COM1 all at the same time.

Incidentally the BBS is a common single line voice/fax and data setup. I
have had no wayt to enable all this in any other platform except OS/2, unless
I wanted to use LINUX, which is not open to me with the other apps I need
to run at the same time all the comm stuff is running.

Nice to see that other packet software is starting to support HTML, and following the lead I set with WinPack V6.2.

However, one problem we are finding in the UK is that some packet BBSs sysops are now banning bulletins containing HTML and deleting any they find. (The current volume of messages on the UK network from *one* sysop complaining about HTML, comfortably exceeds the total volume of HTML messages!)

This type of resistance to anything different is fairly typical here, do other countries have the same problem?

It has been a very long time since I have used Pakratt, but I do remember that you
could exit the software without having the tnc dumped out of kiss mode.
the purpose was to speed reloading of Pakratt. Look over ther parameters
in Packratt carefully to make sure that you are exiting kiss mode when you
exit the program... Now, if you are using tcp-ip or other kiss software it
should still work..
I hope this helps...

Whether you like the answer or not, it does come from the
International (read this registered owner) of .ampr.org, and
the 44.x.y.z network.

I tend to agree with him on the forged address portion. I understand
the use of forged addresses with the recent spamming of email to
people who have posted to usenet news groups, but it is somewhat
up to Brian.

Source record: 30598

Anyone out there can gimme an answer. I guess "unproto" is so antique
that many of recent packet users forgot the cmd structure to do it
(like me for instance). I know you must be in "cmd" mode with whatever
TNC and/or software your using to issue the unproto cmd thusly:
unproto cq via digicallsine
(then you must be in converse or unproto mode to actually use it).
The above example is when your gonna use a one hop patch using 1
digiptr only.
My question is how do you do it thru more than 1 digiptr, just
add spaces then next digi call sine, or do you just seperate the
digipeaters in the path with commas?
73's all

The TNC2 manual, which is very similar is available for download from
ftp.tapr.org in /tapr/software_lib/tnc/tncdocs.exe. It can also be
reached at www.tapr.org.

>> >Anyone with a forged From address doesn't need to know.

That was intemperate of me. However, I think it's a valid frustration;
I attempted to mail him the current list of coordinators so that he
could contact the one in his area, only to have the mail bounce because
of the forged invalid address in his posting.

It's a big enough list that posting it to the net would have been
impolite; that's what e-mail is for. And this is getting to be a
common thing - you see that more and more personal replies that should
have been sent via mail are instead posted because the sender didn't
supply a valid e-mail address.

I have been toying with the idea of modifying the news software so that
any article posted with an unverifyable From: address is not forwarded.
I suspect that's impractical but it might slow down the spread of this
latest festering wound.

Note, by the way, that a full Usenet news feed runs around THREE GIGABYTES
of new articles each day. That's about three new articles a second.
Slowing the growth of Usenet traffic wouldn't be a bad idea.

>our brains. Must be nice living in the country.. ;-|

Actually, the Atlanta MSA is the 10th largest in the US. We have
plenty of cell towers too. (Not much telco microwave anymore,
though, that's gone to fiber.) But cellphones don't operate on the
70cm band, nor did telco microwave, so they don't present a problem
for 56 kb operation. I hear that the folks in San Diego have troubles
with naval radar systems though.

L band is fairly clear here, as is S band (except for the occasional
errant microwave oven). And we can do T1 rates on those bands.
So we have alternatives to 70cm. There is also room on the 219 MHz
and 222 MHz bands for 56 kb systems. (And we operate some 56 kb
systems on those bands.)

If you're having problems with cellphones interfering with operations
on 70cm, I'd suggest that you scrap the crystal receivers you must
be using and switch to something with a hint of selectivity.

Gary

I'm trying to get the Windows 3.1 version of the SemaSoft pager decoder
working with an ICOM R-7100 with direct discriminator output. Results
are uneven; on some paging frequencies it just picks up the preamble.
On others it gets garbled data.

Anyone have any experience with the software?

Also, is there an English translation of the documentation available?

There's a problem with that. Questions sent to TAPR from the web page
go as email. TAPR would probably forward the question to me and I'd
give the same answer as Brian, except that I really wouldn't since the
email would bounce.

Bob.

Ok, it may not go in this group but I have to get the word out somehow so
I am letting you know here.

The funniest web site EVER has now officially opened using REAL AUDIO technology.

Blackout's Box
WWW.BLACKOUT.COM

You will laugh, you will cry, you will pee on yourself... you will cough up your lunch
from the intense amount of laughter you will be experiencing.

You MUST check out Blackout's Box at

http://www.blackout.com

Hear the most insane stuff you have ever heard, broadcast to your
computer instantly over the net with REAL AUDIO 3.0 which you can DL
for FREE if you don't have it already. This is not a commercial site or a business
or any other type of advertisement. It is just a very funny and very FREE site that I
want Everyone to know about. If you like Monty Python, Jerky Boys, Howard Stern,
Kids In The Hall, The State, Robin Williams, Who's Line Is It Anyway,
or anything like that - you will love Blackout's Box, there is nothing like it on the net.
Don't let the words 'prank call' scare you away.. this is no 12 year old fun, this is
intensely funny candid phone call radio drama that critics on and off the net are giving
two thumbs up.

Blackout's Box simply kicks ASS, stop whatever work you are doing,
take a break, and check it out now! Life is short - LAUGH some.

>>The complete story, including the Report and Order, is now available
>online at:
>>
>>http://www.hamradio-online.com

Yes indeed. I touch on that in the story that I wrote on this. Directional antennas can and are used to minimize interference. Also, as I note in the story, the 2.4 GHz band is home to consumer microwave ovens which are a source of significant interference already. The one issue this does change is that unlicensed operations would now be likely to use external antennas, putting their signals out into the real world, as compared to typical unlicensed operation using "low level" antennas inside buildings. The most likely scenario is an increase in the noise floor in the 2.4 GHz and 5.7 GHz allocations. More troubling, perhaps is that we can expect many commercial systems to use these bands for microwave links (look at the list of who filed comments) due to the expected much lower cost of just setting up a link without the costs of licensing and the engineering, environmental and RF safety studies required to apply for a licensed link. On the plus side, more gear would be available for use by Amateurs in these bands.

Check to see if pacratt sets the radio 1 & 2 ports off upon exit: that
would make the display appear to be blank.

2172. RE: Alinco dj-580 connections

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-22 00:00:00 UTC
From: clint.bradford@atdbbs.com
Message-ID: <9704220717003348@atdbbs.com>
Source record: 30481

I have seen several msgs requesting details on how to connect a TNC to
the ALINCO DJ580 h/held,so heres how i did it !!!
(after immense fiddling,these are the connections used for 6 months)

```
tip .. ..ring ....body
. . .
. . .=
O [] ======== 3.5mm plug
. . .=
rx audio ...... . .
..n/c ..gnd

=
O [] ======== 2.5mm plug
: =
TX audio......:
---
: : 10 k resistor
: :
---
:
TX ...........:
```

so,the only connection to the 2.5mm plug is to the TIP!!!! tip=TX audio
TX is to tip via 10k resistor. "sleeve & ring" NO CONNECTIONS

RX audio=TIP of 3.5mm,sleeve NO CONNECTION,body=gnd

Please let me know if this is of any use to you.
don't forget- DO NOT insert/remove plugs while the rig or tnc is on !!

2173. Misc GPS For Sale

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-22 00:00:00 UTC
From: Steve Allen <caipurc@sover.net>
Message-ID: <335CD5AD.ABB@sover.net>
Source record: 30482

For Sale: 32 used Garmin GPS 20 receivers removed from working equipment. These are not handheld GPS navigators. They output NEMA 0183 data and use a MCX coax conn for the ant. Each will be shipped with 1 coax conn to make an antenna cable (extra connectors may be purchased for $3.00 each). No data cables will be shipped with these units, but they may be purchased from Garmin for $9.00 each. The price for these recievers is $70.00 each. We also have 7 units that have various problems, price is $20.00 each. Garmin's flat rate for repair of a GPS 20 is $45.00. The working units have a return period of 15 days from invoice date. There is no return for the inoperative units.

We also have 7 new Matsushita EL31540 GPS01-ST patch antennas with 8.5" of RG-188 with an MCX connector. Price for these is $15.00 each.

Visa, Mastercard or check drawn on a U.S. Bank will be accepted for payment. For orders or questions please send e-mail to Steve Allen, KD1UP at caipurc@sover.net.

Contact Kenwood.
Ask for the manual for the IF232 interface for the TS-450 radio.
They will probably charge you $10 for this manual.
It describes everything you ever wanted to know about the interface.

If you want responses, leave your email address intact.

A lot of us just won't bother to reply if we have to spend
the time locating and editing that email address ...

Rob, I have heard that there is something in the works, called the
Communications Decency Act. This should reduce traffic on the net to
about zero. Would you be satisfied then?

The use of an incorrect FROM address is, in my opinion, a justified
protection from SPAM. However, it would be nice to post your real
address somewhere in the message in order for people to be able to mail
you privately, rather than cluttering up the newgroups.

>Rob, I have heard that there is something in the works, called the
>Communications Decency Act. This should reduce traffic on the net to
>about zero. Would you be satisfied then?

Is the Communications Decency Act also affecting the distribution of
pirated software? (I am not living in the US so I really don't know)

Note that I am not at all saying that I want pictures to be removed
because they are indecent. I think they take unwarranted bandwidth.
When you want to have pictures, go to your nearest computershop and
buy a couple of XXX CD-ROMs (or isn't that as easy in the US as it is
over here?)

Distributing pirated software (that is the "warez" I was talking about)
is illegal in most (if not all) countries, and I fail to see why
Usenet capacity should be given to that.

>The use of an incorrect FROM address is, in my opinion, a justified
>protection from SPAM. However, it would be nice to post your real

I use a fake From: address and a valid Reply-to: line.
Up to now, it seems the spammers are too dumb to understand that scheme.
However, all but the most buggy news/mail software supports it.

Rob

Source record: 30490

The NEC 8201 operates just like the RS Model 100 although the cursor control buttons are arranged better on the NEC. The built-in terminal program is satisfactory for sending and receiving most E-Mail postings. In case you didn't get the manual, believe the previous postings on baud rate, word length, etc., for the Model 100 are also true for the NEC. The main problem is that the display (although very easy to read) is only 40 characters wide. This causes a problem when displaying maps, tables, and other files using greater line depth. Of course you can always output such files to a printer for proper viewing. I bought my NEC new back in '83 for over $400 (list was around $600) and spent a several hundred more to upgrade to a full 32K of RAM Hi Hi. On my NEC the software version is listed as Microsoft #1, wonder if this is the earliest work that Bill Gates produced!! Enjoy the new toy - Pete (W8UXD)

2184. Re: TS450 IF232 Protocol?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-23 00:00:00 UTC
From: tenorman@i1.net
Message-ID: <5jk1np$f6g$1@news1.i1.net>
Source record: 30492
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

The Kenwood TS450 uses the RS-232 serial protocol. The signaling is TTL logic level, that must be converted to +/-12 volt to interface to the more popular "PC" type signaling standard. This can be accomplished by purchasing and interfacing a MAX-232 chip (TTL - RS232 level converter), and a TTL inverter. Get a spec / interfacing sheet on the MAX 232 chip, it will explain how to build a simple converter board. After that, the rig communicates at 4800 baud, Hardware flow control, 8 data bits, 2 stop bits, and no parity (if my memory serves me). After that, the commands to be sent and received should be found in the supplimental guide that comes with the TS-450. If you don't have that book, email me, and I'll send them to ya. Good luck, 73, Mike - WQ0N

From: dwshock@access.usa.net
Message-ID: <5jk8gf$79m$1@shiva.usa.net>
Source record: 30493

Is anyone out there aware of a VHF TNC capable of doing GPS also? I am working on a weather balloon project and something of this nature would sure be handy.

Agreed, but what about the capacity that's going to be needed when
Microsoft and other companies start distributing their *legal* software
over the net, as they have announced they will do?

The bandwidth taken up by naughty pictures will pale into insignificance
when compared with half the planet trying to download an MS Office
upgrade.

Well, of course it depends on what kind of network connection their
customers have. I have been running Linux for more than 4 years, and
all that time it has been possible for me to upgrade my system via the
net. Of course I have never done that, because it would result in an
enormous bill from the phone company, and I can get a CD set for much
less.

Of course this may change when the average user gets a network connection
that is fast enough to download 100MB with acceptable cost.
(currently it costs about 6 times as much to download data at full ISDN
rate during offpeak hours than it costs to buy it on CDROM, over here. for
a 28k8 modem it would be about 15 times as expensive)

Rob

2189. ? Rotor Tracking Software GS232

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-23 00:00:00 UTC
From: cwalthal@mail.delcoelect.com
Message-ID: <5jl5s2$gjk@koinsw08.delcoelect.com>
Source record: 30497

Hi

And thanks for reading this Post, I purchased a Yeasu rotor
and GS232 computer interface. I can not find anyone who sells
automatic tracking software for this rotor. I have found that
most software is for the Kanas City tracker. Does anyone know
if software for the KC Tracker will work with the GS232 or
can I replace the rom in the GS232 to work with this driver.....

Thanks in advance

Has anyone used a class E amplifier on packet?

The one they wrote up in QST was for HF, but I assume one could be built for higher frequencies. The lack of any need for T/R switching seems like an enormous win for higher-speed packet.

2197. Acceptable Packet Telnet Usage

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-23 00:00:00 UTC
From: fgk@iquest.net
Message-ID: <335e94d7.5762347@news.iquest.net>
Source record: 30505

I am new to amateur radio, and to packet. I have a question as to what constitutes acceptable usage of the Telnet function on packet.

I had the following experience. I was using a TCP BBS. The sysop asked me if I would like Telnet access. After he explained what it was, I said yes. He said I had to promise never to access any commercial systems through packet, and I said no problem. So last night, I decided to try out Telnet via packet. I was trying to decide what to access, since commercial systems are out. After some thought, I figured that it should be okay to connect to a weather server, and to a public library card catalog. So I connected to these two, staying connected a short time. I then logged out. Later, when I tried to log in again, I found my access had been removed. I had a somewhat nasty letter from the Sysop in my mailbox saying that I had "explicitly violated the acceptable use rules" by accessing "a commercial university computer network" (this was the card catalog at the college I previously attended).

I have sent a message back to the sysop with an apology for the violation, and stating that I did not realize I was doing anything wrong. My question is this - what sites then *would* be acceptable to access via packet telnet? Is a weather site acceptable? What if the library system was my local public library, instead of a college library? What if there was severe weather and I wanted to access the latest weather warnings?

Any comments appreciated.

Thanks,
Frank Kienast

Russ, one "trick" you might try is to put a DSP with pseudo COR output on the TS450 audio to simulate COR. JPS in Raleigh has such a mod for a little more than the price of their amateur product (high $300's) and you get DSP audio filtering as well.

You might also look at the Link Communications Controllers, They have TTL logic output on each radio port (one direction - to radio) to talk to the Kenwood directly without an interface.

Good luck, John

From: nejeh@gdi.net
Message-ID: <5jmd28$65g@news.gdi.net>
Source record: 30508

Please take the time out to read this email. it is worth your time.

ADVERTISE TO OVER 100 MILLION PEOPLE FOR FREE!!!
Or send a message to millions of people...

NOW YOU CAN ADVERTISE FREE AND GET DRAMATICALLY
MORE RESPONSES THAN ADVERTISING ON NATIONAL TELEVISION

With E-mail your potential customer is forced to read at least the
headline of your letter. Unlike TV, magazines, newspaper ads, and
direct mail where more than 99.99% of the recipients will skip right
over your advertisement.

TURNS YOUR COMPUTER INTO A CASH REGISTER: Conservative estimates indicate
well over 100 MILLION people will have E-mail accounts in the next year!
E-Mail Blaster turns your computer into a cash register by giving you FREE,
immediate access to all of them. Do you think some of the more than 100
million people with E-mail addresses would be interested in your products or
services? Even if you don't have your own products or services you can
still make money buy promoting our computer software!!!
You can make money with our new software called E-MAIL BLASTER

Here's how:
* By Using E-Mail To Sell Your Products & Services
* By Using E-Mail To Sell our Computer Software such as: Email Blaster, Web Walker,
Email Lock Box etc.
* By Renting or Selling Your E-mail Addresses
* By Becoming A Distributor for e-mail BLASTER

MUCH FASTER: With bulk E-mail you get responses back in 1 to 4
days instead of waiting weeks or months like with television or print
advertising. You can begin filling orders the same day you send E-mail.

FREE ADVERTISING WORTH MILLIONS: It costs millions of dollars to mail out
millions of letters using the United States Postal Service! Now you can
send your ad to MILLIONS of people for FREE using E-Mail BLASTER

E-MAIL BLASTER IS ACTUALLY 3 PROGRAMS IN 1: E-Mail Blaster is amazing new
technology and the most advanced bulk E-mail software on the market today.
(1) E-Mail BLASTER automatically extracts E-mail addresses from America
Online, CompuServe, Prodigy, and the other online services, the Internet,
web pages, news groups, and hundreds of other sources. (2) E-Mail BLASTER
automatically stores the E-mail addresses in your computer along with
keywords that describe hobbies and interests to created highly targeted
E-mail addresses. (3) E-Mail BLASTER sends your marketing letter or ad to
MILLIONS of targeted E-mail addresses at the push of a single button!

HOW DOES E-MAIL BLASTER WORK? E-Mail Blaster has dozens of special filters to automatically harvest E-mail addresses from major online services such as: America OnLine, Compuserve, Delphi, Genie, and of course the internet.

AOL AUTO EXTRACTOR: E-Mail Blaster has many special features like the AOL Auto Extractor that let's you use a regular dial-up Internet connection to collect names and addresses from America Online. Collect America Online addresses without being a member. Allows you to download names and addresses from America Online without paying membership fees or online charges. Auto Extractor for all of the online services and Special E-mail database search engines will also be available at no additional charge.

SIMPLE TO USE: E-Mail Blaster does all the work for you. Unlike other programs where you must cut & paste addresses, E-Mail Blaster does it for you automatically. And, unlike other E-mail programs, with E-Mail Blaster there is no need to purchase any additional software

SPEED: Your time is important. E-MAIL Blaster is DRAMATICALLY FASTER at extracting and sending E-mails than all the other programs on the market that we tested it against.

NO SPECIAL EQUIPMENT NEEDED: E-Mail Blaster runs on a PC with Windows 3.xx Windows 95, Windows NT, a 386 or faster processor, 4 MB RAM, and a hard drive with at least 10 MB free and your own SLIP or PPP connection. No other software needed. Also runs on a Macintosh with Soft Windows installed.

****
This message was sent using E-Mail Blaster.

E-Mail Blaster is The World's Leading Bulk E-mail software.
With E-Mail Blaster you can advertise to over 100 million people for FREE!

Cost: We are giving away Email Blaster your only cost is $165.00 License fee.

THAT'S IT!!!

Our company is in the software business of developing cutting edge products, so we know if you have the opportunity to use our software FREE you will be our future customers. We know we need you to make our software business a true success!

(Please if our lists are incorrect put "remove" in the subject and just hit "REPLY" and you will not be bothered again. Please forgive our mistake).

Well the HTML standard is well accepted in Australia and there is no
censoring of any HTML messages. There is a high level of tolerance of
diverse technologies but again you'll always have small vocal pockets
that want to see a status quo and feel they are in control

The thrill of annonymity and the control that these people feel they
can exert on the rest of the Amateur Community, sees them behaving in
reckless ways and biy do they stand out like a sore thumb.

Life goes on OUTSIDE Ham radio and its important to keep a level
perspective. Laugh at these fools as they generally don't have a life
besides Ham Radio !

Cheers..Pete..vk2yx

2204. Very High Speed Packet Hardware

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-24 00:00:00 UTC
From: marty@trucom.com
Message-ID: <335ee6bf.25769629@news.trucom.com>
Source record: 30414

Hello, Folks:

I've been spending a lot of time lately looking into hardware and software for running very high speed packet over RF links and have come to one major conclusion...

There is no source of detailed, complete information needed to do this. There are a lot of little tidbits scattered here and there, but nothing complete and accurate that can be duplicated.

What I am talking about here is REALLY fast links... Not less than 100 Kbps. Sure, we're talking UHF+ frequencies and line of sight, but that is what we need here. I suspect that there are a lot of other areas, groups, and individuals that need the same.

What we need here is a complete, easily duplicated system that needs no additional engineering work done to it to be able to work. Frankly, our small group has neither the time nor the expertise to re-design a partial hardware system to make it work.

We also need something that we can build to keep down the costs... We are on a VERY tight budget here!

Let me give you a few of the things that we have already looked at...

(1) The N6GN Higher Speed Packet stuff : None of this is complete. Glenn even states that it isn't and that he doesn't have the time to make it such. I can understand that... I'm in the same boat here.

(2) The S53MV 23cm PSK System for 1.2 Mbps : Looks like a nice system, but the information is somewhat sparse... No specs, no operational or set-up info. Also, the related USCC card has almost no info at all available.

(3) Paccomm stuff in general : Never got a reply to E-Mail, US Mail, or phone calls. Who knows?

(4) Baycom : Are they even around anymore?

You get the idea.

So, what I am asking is IF there is a source for teh above sorts of information? If so, where and who do I talk to?

If not, it seems to me that this would make a GREAT project for someone (group, perhaps?)... Compile, test, and make available (for lack of a better term) packages of information that would allow others to really make the move to high speed packet systems.

Any comments?

Take Care & 73

SHF Microwave Parts Company http://www.shfmicro.com
has most of what you're asking for. They even use to have
the 13055/10116 chips.

The only problem is that they don't take Visa..

--Magne / la1bfa
```

I have purchased from SHF�Microwave Parts Company and found them to be excellent. As Magne said, the only problem is that they don't take credit cards. I also had some problems because Australian International Money Orders go via American Express which does not have an office in their town. I�used an International Bank Cheque and got a fast turn around from SHF�Microwave Parts.

There may be more to the story. But based on what you said, your sysop is a jerk.

Under the current rules you could have telneted to a pizzas parlor and ordered a pizza. To react as he did to you accessing a college is just plain odd.

If my memory has not gone totally bad ... seems like sometime in the
past, perhaps 7-8 years ago, there was some hardware built that used
the AUI connector for this purpose. Wish I could give a better
reference.

I think that, like so many other things in Ham Radio, particularly
packet, that you are at the personal whims of the station operator...
I'm not sure if that is really due to any specific reasons or not but
it is a fact of life.

The problem comes in when you have a station operator that, in some
ways, goes beyond what the rules state. You have to guess at what the
station operator considers to be legal.

Add to that the problem that the rules really don't address Internet
access via Amateur Radio, and you have a situation where every SysOp

is making up the rules as they go along, often changing from day to day (or more often!) so no one really knows what can and can't be done on a particular system.

My own definition is from Part 97: "... with pecuniary interest...". In other words, if me, the user, and the site in question make no money from the access _AND_ other sections of Part 97 are not violated (ie adult content, illegal activities, etc.) then access to that site is OK.

This is new stuff and, as I said, the rules really don't address it very well right now.

Perhaps they should.

What constitutes "commercial" use of ham radio is a topic that hams just *love* to debate, and you're certain to hear a wide variety of answers to your question. Recent changes to the regulations have made them much more permissive in this area than in times past, and IMHO your use of the system was not in violation of the regulations.

Of coure, the best rule of thumb when operating through another ham's station (e.g. packet BBS, repeater, etc.) is to always do things the way your host likes to see them done. Since you've obviously made every effort to do so in this case, your apology should be sufficient to get you back into the good graces of the BBS sysop -- assuming he's a reasonable fellow. If he's not, you ought probably start looking for a better BBS....

The baycom site seems to be down tonight. I located another website
with it available for download:
http://www.umecut.maine.edu/~baack/bay.htm

Best of luck. I have run BayCom for years, and have been very happy
with it. Years ago it would only run under DOS, and that's the way I
still have it setup. Not sure if anyone has come up with a way to run
it under Windows yet. I wonder if the coming of Pentiums may have made
it possible by now (anybody know?)

Hello Richard.

The KAM Plus comes standard with a real-time clock - you don't need to add one.

If you mean the older KAM (not the plus) then you add the Dallas Semiconductors DS1216C to have a real-time clock.

2230. Software Performance with the Baycom Modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-25 00:00:00 UTC
From: Rich Abbot <abbot@pez.bell-labs.com>
Message-ID: <3360DC08.4E5E@pez.bell-labs.com>
Source record: 30440

Hi All,

I use a Tigertronics BP-2M Baycom-type modem on
2m packet. There is a varitey of software that
is available for this application. For example,
the Baycom team provides the Baycom terminal
program with the L2 packet driver. As an
alternative, I've also tried SuperPacket 6.5
with both the TFPCX and TFX packet drivers.

My question is, why do I see such a HUUUGE
difference in performance between these two
similar applications?

The Baycom-L2 combination is a smooth performer.
I see little difference in throughput between this
app and my hardware-based MFJ TAPR-2 clone.

By contrast, SP+TFPCX or SP+TFX performs miserably.
The effect I see is that one ASCII line is ok out of
every four that a PBBS sends. SP seems to send a REJect
on every other PBBS transmission, although the textual
information looks correct, and the channel is free of
collisions. Listing, say, 50 bulletin titles can take
more than 10 minutes! If I quit SP, start Baycom+L2,
and reconnect to the same PBBS, the improvement is
very dramatic.

Perhaps there is something misconfigured in my SP,
TFPCX, or TFX setup. It's hard to say, though, because
much of the documentation is in German.

So is anybody out there successfully using SP with
their Baycom modem? Is there another program besides
these two that people prefer?

Thanks and 73,

Rich, WB2MBM

I believe Bdale Garbee, one of the designers of the 10GHz system, has said
that he looked into using ethernet cards but they won't work for radio
applications because the ethernet timing standards limit the minimum
speed, and the maximum distance between nodes. These timings are
hard-wired into the silicon, and since they can't be changed it's not possible
to use ethernet cards in this way.

><medcalf@prairie.lakes.com>

The station who has the problem made it clear it was the KAM+. We had
a problem with the dallas chips in the KPC$ a while back and I
obtained new ones (battery back up had failed). It seems the KAM+
will retain settings on power down but no clock which is why he
thought the real time clock was not fitted.

Precisely! I don't really need to get 300 watts out of it either.

It's the overall design that is appealing, both due to its simplicity
and the lack of T/R switching.

Anyone know of any FETs that would switch fast enough?

Do a lycos search for baycom 1.5. its out their.
viti my website and click the radio link to find my portable packet
setup as seen in QST.

couldnt run baycom under win 3.11 but win95 runs fine.

2238. Connecticut QSO Party May 3-4, 1997

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-25 00:00:00 UTC
From: KD1YV <jimkd1yv@ix.netcom.com>
Message-ID: <33613A4B.4932@ix.netcom.com>
Source record: 30448
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.misc,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc

1997 CONNECTICUT QSO PARTY - OPERATING RULES

Connecticut QSO party, sponsored by the Candlewood ARA, 2000Z May 3
until 2000Z May 4, with a rest period 0400Z - 1200Z. Phone, RTTY and CW.

Work stations once per band and mode, mobiles as they cross county
lines. No repeater QSOs.

Single operator, fixed/mobile, Novice, QRP(5W), Multi-single
Multi-multi
classes plus Connecticut club competition.

Connecticut stations may contact other Connecticut stations for
QSO/multiplier credit.

Connecticut stations exchange report and county; others exchange
report
and state/province/DXCC country. Non CT stations work CT stations only.

CW - 40 KHz. up from lower band edges; Novices 25 KHz. up from low
end;
Phone - 1.860, 3.915, 7.280, 14.280, 21.380 28.380. VHF - 50.150,
144.200,
146.580. RTTY - Normal RTTY Bands . All bands (HF,VHF, UHF) except
WARC bands count.

Score one point per phone or RTTY QSO and two points per CW QSO.
QSOs
with club station W1QI and ARRL HQ station W1AW count 5 points.

Connecticut stations multiply QSO points by states/
provinces/Connecticut
counties worked (DX only one multiplier); others multiply by Connecticut
counties worked (work CT stations only).

Plaques and certificates (100 point minimum). Special certificate
for
working all 8 Connecticut counties.

Send entry and SASE for results by June 3 to CARA, P.O. Box 3441,
Danbury CT 06813-3441

Jerry;
Have you considered how you might feel if you find yourself in the
line of fire for one of these links? I presume they'll be mostly if not
all fixed azimuth beams aimed at one facility's recv. antenna. I'm not
trying to rattle your chain about this, but, it seems that if there's a
proliferation of these installations (and I think there's bound to be)
then ther'll also be a proliferation of hams who can't do much but pack up
and relocate. ...or am I missing something??
regards...
de VE3 TNW... Tony

I am looking for how-to configuration docs/info. I have volunteered to be on the local packet committee and need to learn how to maintain our nodes. Also have a local ham who INSISTS on running a BBS on a frequency we all agreed to keep for keyboard/emergency purposes, so the most pressing thing for now is to both "budlist" him and turn off the DIGI (he abuses it in this fashion too) If I could download the info it would be great but we need to get the info any way we can. Thanks in advance for any help you can provide.

2246. Re: Acceptable Packet Telnet Usage - SUMMARY

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-26 00:00:00 UTC
From: fgk@iquest.net
Message-ID: <33617732.19365741@news.iquest.net>
Source record: 30450

I received a number of E-mail responses to my question about what constitutes acceptable Telnet access via packet. I will summarize here.

1. FCC rules are not completely clear on this area. However, use for any business purpose, or accessing any site with language not permitted on amateur radio, is definitely prohibited.

2. As with a regular BBS, the sysop may add his/her own rules in addition to the above.

I had a chat via E-mail with the sysop of the board in question. He spelled out his rules as being that one could only access sites that are directly ham-related (such as *.ampr.org, callsign servers, ham ftp software servers, etc.), and weather sites if needed for safety purposes. The sysop re-instated my telnet access, and in return I agreed not to access any sites outside of AMPR without checking with him first.

Thanks for all your replies.

>to use ethernet cards in this way.

I don't know about 10baseT, but for coaxial based ethernets, if I
remember correctly, the distance limit is partially due to cable
losses (Thin-wire) and collision detection. The maximum cable length
and thus propagation delay and the minimum message length are
interrelated. The message must be long enough so that the start of the
message will propagate to the most remote parts of the cable while the
transmission still continues. If an other station has started the
transmission at the exact same time, its signal will arrive when the
original station is still transmitting and it can detect the
collision, since the signal voltage in the cable is not the same as
transmitted.

If, instead of the 10baseT cable you are using the AUI cable with
separate twisted pairs for Tx, Rx and collision detect you should not
have to worry about distance limitations due to collisions. You still
have to work in half-duplex, since I doubt that any cheap ethernet
card would operate in full duplex, even with separate Rx or Tx lines.

Source record: 30458

I would like to offer a few comments regarding packet/internet gateways
that some may not agree with and I don't mean to direct this to Frank,
but as a general reply:

First, internet gateways are substatually different from packet bulletin
boards. Internet gateways are often set up at the site of internet
providers
who sell their services to the general public, but grant the ham
community
access for free because they feel they are providing a public service.
They
don't take kindly to people using that access to surf the net. The
sysop may
lose his access if he allows what his source considers abuse. These
people
don't give a flip what the FCC allows or doesn't. College, university
and
businesses with internet lines are so afraid of hackers they are
extremely
reluctant to let hams hook into their hubs at all. It doesn't take much
for them to pull the plug....its happening fairly often.

Secondly, the gateway is generally set up to provide a specialized
service,
such as packet bulletin forwarding or the worldwide converse
conference. Many
have callbook and weather servers set up without having to telnet to
commercial
sites. Most amprnet BBSs are set up with short welcome messages and BBS
prompt
line. Most regular internet telnet sites, on the other hand, have
several pages
of info that swamp the 1200 baud radio link. This pisses off other
packet users
who promptly complain to the sysop.

Third, almost everybody (here) has internet telephone access, so why not
use the
gateway for packet and amprnet services and your ISP for other internet
use?
The guy (sysop) is GIVING us something for nothing, he is under no
obligation
to provide any special or specific services.

The system I'm building at the moment is based on the HP200LX.

This is basically an IBM XT in a palm top. Runs DOS 5.0 and
has 640KBit of RAM, serial port and PCMCIA.

The BAYCOM modems seems to work well with the BAYCOM DOS
based TNC software.

Do a search on hp200 on the Web. There are two pages (sorry lost
the URL) of Hams who've already done this.

P> address for MFJ ???? many thanks

I have had EXACTLY the same problem! In addition, the TNC locks up
when entering KISS mode. I tried to replace the firmware with
"TheFirmWare", which only made things worse... It locked up after a
couple of commands.

I don't know what causes this problem, but I had to return my TNC to
get a new I/O chip just after I had bought it. I have a feeling that
the problem has something to do with a defect chip, either RAM , I/O
controller or CPU.

Please let me know if you find a solution!

MArius

PS. there is a link to the MFJ web-page from

On this same subject, does anyone run packet on a PSION 3a. I have been wanting to run packet on my psion for some time but have not been able to figure out how.

(a psion is a small pocket computer made in England)

Body handling: Inline uuencoded payload not displayed: Serial.pcx

see my setup on the MAR 97 QST and read my article "Portable Packets"
Like Jason I have been using my HP200 and BP-2 Baypac modem for some time.
visit the following site for info and piture of my setup
http://www.gatecom.com/~maccabeus/hp-qst.html

==========
"Portable Packets" FAQ
Baycom BP-2 AX.25
145.050 MHz (1200Bd)

73's de QTH : Trenton, Mi. USA
Phil LOC : EN82jd N 42:14' W 083:20'
KC8DQF Packet : kc8dqf@kb8rmx.ampr.org
E-Mail : maccabeus@gatecom.com
Web site: http://www.gatecom.com/~maccabeus

The HP200lx stands in a class all its own; at $500 it should!
Note that items preceeded by a ' * ' are not found in the earlier
HP??lx models, the new omnigo, or MOST other 'organizers'
and can be found at some office supply stores or used at the
newsgroup comp.sys.palmtops

*The HP200lx is a true microPC XT
*IBM XT 80186 at 7.91Mhz
*DOS 5.0 built in will run most standard DOS text or graphics programs.
CGA *fully compatable; 640 x 400 (2c) 320 x 200 (4c)
(1) 10pin RS-232 serial port. connectors available.
(1) type II v2.01 PCMCIA slot (I have 2 10MB cardds and 1 14.4 modem)
uses 2 AA batteries .
tons of custom software/freeware/shareware for the HPs
*All the DOS programs you could want practically...
see the comp.sys.palmtops newsgroup

I have run MS flightsim 4.0, jet fighter II, aprs, baycom, geoclock,
traksat (a graphical realtime sat tracker, updates every 4-5 seconds on
the HP acceptable in the field)
plus some useful organizer stuff. I mostly run in dos with Norton
Commander. I also
use it to access my internet account when traveling. email, newsgroups,
ftp, www, etc

Baycom is just a standard dos program. i just turn on the serial port,
hook up the tnc
and radio, and baycom.exe away I go! I can install to my hp by serial

cable and either
using laplink, dos interlink, or norton commander. Or install the flash
card into my
pcmcia on my notebook. the reinstall into my hp after loading from disk to
card.

any questions just ask. the serial port can be activated by a built in
dos routine,
then controlled 'on-the-fly' by an internet available program. we are even
working on
jnos with the baypac modem. So far I can get JNOS to run from DOS only
using
the BP-2 on my Pentium notebook. The HP200 will require more work.

1- Can it work with a laptop instead of palmtop?

I use the same tnc-cables-radio- and files on my palmtop as well
as my Lifebook 520 laptop

2- Is the BP-2 modem compatible with any laptop PC?
as long as it is/has ... minimum (this is a yes)

DOS 5.0 fully compatable So far WinCE has not been successful.
RS-232 serial port fully compliant
CGA compatable
300Kb RAM
500Kb disk space min (ie PCMCIA flash cards)

3- Is the software that comes with the BP-2 compatible with any windows
based laptop PC?

So far only WIN95 seems to handle the interrupts properly
Obviously DOS or a DOS window (W95 only). But this is
at your own risk as Tigertronics does not advise it. Some
of us have been successful but some machines have also
crashed the BP requiring mailing the unit in for reallignment.
This is at your own risk. I needed it in windows so I tried it.
My specific setup has run under windows95 (W95 only) for
10 months. DO NOT run BPMODE under windows NO
MATTER WHAT!

4- Does the BP-2 modem run on batteries and what kind?
How did you power the BayPac modem for your HPC portable packet setup? I
know that the BayPac can be powered by the serial port when used in
conjunction
with a conventional laptop because it supplies around +/-10 volts on pins 4
and
7 of the DB9 connector. Considering that HPC's run off 2-AA cells (3
volts), do
you power the modem externally or is 3 volts enough to power the modem from
the
HPC's serial port voltage?

Powered right off of the serial port, advertised requirement 9mA. This means
that no external power is needed for the BP-2(m). You provide power for the HP and HT while the BP-2 gets all it needs directly from the serial port.
This adds almost no load to your system thus the BP will not significantly increase your power drain.

5- This one's due to my ignorance of HPC's in general. How do you load programs on an HPC? I know there's no hard drive in an HPC. Is the serial port
used to link to a PC or laptop to upload/download software? Is special software
necessary in the PC/laptop to link the 2 units together?

Using the stats below it is simply a matter of soldering up a cable to connect
the HP200lx's serial port to your PC using a NullModem cable. Run a variety
of transfer programs like "Norton Commander" "Laplink" or even DOS' "Interlink".
Make sure the Palmtops serial port is activated(see manual) before launching
apps. Set both programs for the appropriate ports (HP200 port com1). Most
of these programs are basic file managers for transfering files. While Zip.com
and DOS Interlnk.exe map the HP200 as an external drive.

Programs are stored on the HPs limited RamDrive C: of 200-400K. A better solution is to purchase a PCMCIA memory card. SRAM cards or faster
but require a lithium battery to maintain memory, these also tend to cost more
per MB and are generally in smaller capacities of <2MB. A FLASH card is comparitively slower. Not enough to bother most users, if it does buy a pentium :-)
The advantage of a FLASH card is that it is a non-volitile EEPROM. No batterries
required for storage, thus less chance of a crash.

A p p l i c a t i o n N O T E

Following is a schematic diagram for the construction of a cable
which connects the HP200lx's 10PIN serial to both the PC/AT's
9-pin serial, 9-pin nullmodem and a standard DB-25-pin connector:
for use with I/O port to devices. I recommend wiring the HP200
with a standard DB-9 Male Serial plug for use with Modems and TNCs.
Use a separate null modem connector for networking computers.

HP200 Serial Name DB-9 NullModem DB-25 serial
1 CD 1 1 8
2 RD 2 3 3
3 TD 3 2 2

4 DTR 4 6 20
5 Gnd 5 5 7
6 DSR 6 4 6
7 RTS 7 8 4
8 CTS 8 7 5
9 RI 9 9 22
10 Gnd 5 5 7

For modem type devices plug the 10pin into the HP and the DB-9Male
into the I/O device. For Networking PCs insert the NullModem
adapter between the DB-9 and the PC; or else use a separate cable
wired for NullModem with a DB-9Female on the PC end. I find that
carrying a connector requires less space than a second cable.

6- The connection between HT and BP-2 looks homemade from the picture in
the article. Has it been difficult to obtain and were connection
instruction present in the BP-2 package?

the instructions are included, this will work on yaesu FT-11, Radio Shack
HTX-202,
and if a stereo plug is used instead of mono for the speaker (not using the
middle
ring) it will work on Alinco DJ-F1T. These are my actuall runs.
take a typical phone cord. look at the end with the clip up. (ends are
reversed)

clip
_____/-------_____
black-red-green-yellow <- this will be the end you work with.

cut clip from phone cord leaving an amount of cord as your cable (I use 12"
or less)
keep the cord under 3' to lessen interference. You need a standard 1/8"
stereo or
mono plug for the speaker (green to speaker tip; black to barrel ground).
Red is
unused; while yellow goes to the mic-miniplug tip.

Now you just need a serial cable and serial=parrallel port-adapter from
radio snack.

The TNC comes with BayCom 1.4 but it has bugs. Baycom 1.5 is improved and
is
on the internet. goto a web search engine and look for "baycom 1.5".
use the manual from 1.4 though as the manual for 1.5 is in german. the
help file for 1.5 is in english.
print the 1.4 manual to learn the basics and print the 1.5 help file
(TERMHELP.SCC) for specifics. I can always send you my config to help get
you started.

Eimac type YC156. This is the same basic tube as a 4CX5000. It was designed for the medical industry and has a rating of 6500 volts at 4 amps when used in a pulsed mode.This tube was used in applications to 35 mc but will operate at higher frequencies. See the data sheets on the 4CX5000. No socket is necessary for this tube, it will mount in a 3 1/2 inch diameter clear hole, and the grid ring will bolt to the chassis. Height is overall height is 8 inches.

Tube is used but emission is guaranteed for full output. $325 each.

Source record: 30378

Everyone running a BBS should just be taken out and shot :-)

Seriously. Your letter reeks of 1200 baud. I would suggeest
you not go down that road. At a minimum it was obsolete
4 to 5 years ago. Let the LIDS have it. For keyboard activity
start building a repeater (UHF) at a minimum. That, plus a TEKK,
and a Kantronics 9612, and you are finished with the packet BBS
hogwash. At last you will have fun.

Steve

Here in OKC K5HP finally got the repeater working after about
7 years building it. While I gave up long ago waiting for it,
(K5JB built the TAPR modem for it, and died before he even got
to use it). Not to minimize Terry's worth, he's a do'er, but
he's busy :-)

Anyway, now that it's up, it is really nice. X-1 nodes are kind
of pigs though, as they only do 256 size packets, but the JNOS
and TNOS will do big packets (me and N0ELS did 1024 byte packets
and it was a screamer). I do JNOS packet segmentation now, which
is compatible with the X-1 packet size. That way we only send
one TCP/IP header per 4 packets. Woof-Woof!

As usual, everyone wants to be a netrom broadcaster. There's
about 20 nodes in the list now, and not even 4 of them are worth
connecting to.

That's the problem with packet. After keyboard chat and email, it's
basically a worthless endeavor. When we get to 115k baud, then it
will be useful. You can do 115k now, but it'll cost you 1500 a node.

Steve

There will be a proliferation of very low power signals in very tight
beams. They will presumeably be quite frequency stable (the key to high
data rates) making them easy to filter out. Have you ever noticed the
high power 10GHz microwave links the telecoms have used for years?
In city hams may face a greater challenge but these problems should be
solvable if we don't run off all the technical people in this hobby.
I don't think it is nearly the problem that we were presented in
Central America with the confiscation of the entire UHF spectrum You
can't adapt to new challenges when you have no access at all.

2271. HF radio access to Internet possible ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-28 00:00:00 UTC
From: David Berghouse <davidj@loom.com.au>
Message-ID: <33640461.0@work.loom.net.au>
Source record: 30381

An acquaintence is a keen sailor (yachts) and has asked me to inquire regarding Internet access (for email) from his sailing boat. He will be sailing up the Australian coast (to Darwin) within the next few months would like to be able to keep in contact with friends/family by email if this is possible.

Can a HF radio service offer this ?

I know that ISP's could be accessed using a mobile phone - but that doesn't work far out to sea.

David Berghouse

Sounds like "all" of you did not agree on your local frequency plan,
but that is another issue involving national, regional, and local band
plans and real frequency coordinators...

The easiest way to get the docs will be to download the complete X1j4
package. Try the following URL:

ftp://ftp.funet.fi

in the (as I recall) pub/ham/packet directory. (that may not be the
exact directory, but it is close!)

The docs are fairly clear for routine stuff.

2275. Re: Help on 2Mb/s MicroWave Data Link

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-28 00:00:00 UTC
From: ge@sr.hp.com
Message-ID: <5k2ark$b8l@canyon.sr.hp.com>
Source record: 30385

The doubt about using Ethernet controllers at speeds lower than 10 MBps on the microwave hardware originally was communicated to Kevin N6RCE, the coauthor of the original Ham Radio Magazine article, by someone (I'm afraid I don't know who) involved with design of Ethernet chip set silicon. The message was that even a small percentage deviation from 10 MBps was not going to succeed. Kevin was trying to quickly interface my RF hardware for amateur tcp/ip use and rather than pursue Ethernet further at the time, Kevin opted to stick some IBM PCLAN adapters on the radios and write/modfy approriate drivers. As the article detailed, this worked fine.

As I had never understood how Ethernet silicon could "know" the difference between say, 10 Mbps and 9 Mbps or even likely considerably greater deltas, I have for a long time looked for someone to do a simple experiment with a pair of cards and different clock frequencies. I have mentioned this on my web pages.
Recently, DG1KJD took up the challenge and tried it. The short summary is that 2 Mbps can work just fine. Please see my pages for his notes. Many thanks to Jens for doing this.

I suppose the question of shipping straight Ethernet protocol over radio and proper amateur identification still remains but I'll leave that to someone else to worry about.

As far as the RF hardware goes, I believe that it is not a difficult matter to make the radio interface look like Ethernet. Again, please see the pages for a few notes on FDX and interfacing.

Please see:
http://www.tapr.org/~n6gn/uwavelink/uwv.html

and in particular the "Higher Speeds" section:

http://www.tapr.org/~n6gn/uwavelink/faster.html

One aside that I'm fond of pointing out about is an apparantly little-recognized facet of the Ethernet distance limitation. While it's true that assuring proper operation of collision detection is a limitation, as has been pointed out on this thread already, it is also very interesting to make a back-of-envelope estimate of the noise/distortion limits. My estimates are that with typical cables and installation (tap) techniques, ethernet DX is not far from being limited by signal/noise ratio as well as CD. It is interesting that even in a relatively controlled environment like coax, losses, noise and (particularly) multipath propagation is a limiter. Multipath becomes an issue because of reflections off of tap points, splices and any other

discontinuities in the cable. This is particularly of interest to me because of my experiences with networking over radio and the problems the radio path adds.
It's for these same sorts of reasons that I feel that repairing the RF paths is such an important aspect to higher speed amateur networking. See the OCAR pages for more details.

1997 CONNECTICUT QSO PARTY - OPERATING RULES

Connecticut QSO party, sponsored by the Candlewood ARA, 2000Z May 3
until 2000Z May 4, with a rest period 0400Z - 1200Z. Phone, RTTY and CW.

Work stations once per band and mode, mobiles as they cross county
lines. No repeater QSOs.

Single operator, fixed/mobile, Novice, QRP(5W), Multi-single
Multi-multi
classes plus Connecticut club competition.

Connecticut stations may contact other Connecticut stations for
QSO/multiplier credit.

Connecticut stations exchange report and county; others exchange
report
and state/province/DXCC country. Non CT stations work CT stations only.

CW - 40 KHz. up from lower band edges; Novices 25 KHz. up from low
end;
Phone - 1.860, 3.915, 7.280, 14.280, 21.380 28.380. VHF - 50.150,
144.200,
146.580. RTTY - Normal RTTY Bands . All bands (HF,VHF, UHF) except
WARC bands count.

Score one point per phone or RTTY QSO and two points per CW QSO.
QSOs
with club station W1QI and ARRL HQ station W1AW count 5 points.

Connecticut stations multiply QSO points by states/
provinces/Connecticut
counties worked (DX only one multiplier); others multiply by Connecticut
counties worked (work CT stations only).

Plaques and certificates (100 point minimum). Special certificate
for
working all 8 Connecticut counties.

Send entry and SASE for results by June 3 to CARA, P.O. Box 3441,
Danbury CT 06813-3441

The gateway folks need to be more careful than they are now.

Last night, I telnetted to a commercial ISP via kb6le-3 in the Seattle
area.
The first thing I saw on my screen was an advertisement for the
services of that ISP. Clearly business use of ham radio.

There were several such connections available to me, including a couple
ISPs, and the TAPR business site.

Just about any HT is going to do the job for you, based on your description. You can probably get a Yaesu FT-470 used for that price, probably with some extra accessories. I have one and it works great.

>2. Packet Terminal Controller (for Pentium IBM Compatible PC. 1200bps

The USCC driver is largely based on code contributed by the BayCom Group,
only minor adjustments had to be made to make it fit into PC/FlexNets
modular structure. So this is just like I tried to explain in my previous
posting: Someone found that it would be nice to have a driver for the USCC
adapter, so...

> [..]
> IMHO, the adaptation of the existing (U)SCC driver in Flexnet, assuming
> that it has been reasonably well coded, to other SCC cards would have
> been a trivial job to undertake. It is not reasonable to expect others

> to write a driver from scratch in this case.

Nobody expects others to write the driver from scratch. Check the sources of the NOS derivates, or Linux. You will definitely find enough code floating around to start with. You might say: Why should I, it's much easier to adapt the existing USCC driver, and I'd answer: Why me, I'm not interested in having a driver for this card and I'm not willing to spend the time in testing and debugging.

> Furthermore I would like to add that a PA0HZP SCC card including external
> modem was provided to DK7WJ for free long before PC/Flexnet appeared, I

Pretty nice! You seem to think that your generous, but unasked gift implies the right to actually demand DK7WJ writing a driver for it. That's real square :-)

> I think the non-availability of a driver for this card at least has some
> unpleasant smell around it.

(*cough*) Open the window then, take a breath. This will help you more than posting annoying articles into this group.

Matthias

2292. RITTY 2 Demo Available

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-29 00:00:00 UTC
From: n1rct@megalink.net
Message-ID: <5k4spf$hgp@news.megalink.net>
Source record: 30400

Brian K6STI has made available a demo version of RITTY Ver 2.00 available for the first time. It won't transmit and some of the "Gee Whiz!" features are disabled but you can see what it is all about. This version will also do RTTY (but not Pactor) on many generic sound cards, not just the real SoundBlaster 16, although the SB 16 is best for the long run (no pun intended). The complete instruction manual is included also for your review. It becomes fully functional as soon as a RITTY.LIC file is purchased from K6STI.

You can download it thru Jim's Gazette or direct from:

http://www.megalink.net/~n1rct/rit2/rit2.html

The instruction manual alone is a great information source on DSP, RTTY, and Pactor from a master. If you have already puchased RITTY 2, the URL above will be the normal source for downloading any future updates or just a new copy. The demo becomes the real thing when you have a RITTY.LIC file from Brian.

RITTY works "standalone" and as the "TNC" for RTTY by WF1B and HAM V by OH2GI. There are also several articles on RITTY by Neal ON9CNC, K6STI, and myself on the above URL.

2293. High Speed Packet via ATV?

Source record: 30401

Has anyone considered the Hughes Data Systems approach to distributing web content? An end user dials in via 28.8 and sends a request for web content. Instead of being returned via the phone connection, the content is returned via dss satellite at 400kb.

I just picked up the Hauppauge Wincast/TV card for use with NetMeeting and Internet Phone. A couple hams in my club are using it for contacting each other and when dialing into other repeaters around the world via the Internet. Totally separate from its ability to accept input from a standard video source (like a video camera) and reuse it for video conferencing, the card can also decode Intercast data that is transmitted in the video blanking interval at near-ISDN (105kb) speeds, regardless of the medium (air, cable, dss, c-band). The card works under Win95 and Linux (key for hams).

A candian firm, http://www.norpak.ca, markets encoders and decoders for this medium. They claim to support transfer rates of up to 188kb raw and 150kb using FEC. I also believe the *encoders* are priced around $150.

How many of us have a 1200 baud TNC laying around collecting dust? It seems to me that the best thing to do (on the server side) is to assemble a Linux workstation with a 1200-baud TNC for accepting web content requests and a VBI encoder/ATV transmitter for transmitting web content. On the receive side, you'd need a Linux or Windows PC, a 1200 baud TNC, an ATV downconverter (or cable-ready VCR and rabbit ears), and a VBI-compatible (and possibly Linux compatible) TV card such as the Wincast.

You'd have two choices for video content, too (remember, this *is* ATV after all). You could output normal video like any old ATV repeater and watch it in a resizable window on the receiving PC's screens. Or better yet, by using a VGA-to-NTSC converter, broadcast an image of the controlling PC's console constantly displaying a list of stations currently being serviced, kinda like PACSAT.

That would help the users better plan for system performance. They'd know to not get on when five or six other users are receiving content, but can still watch the ATV output until the list shrinks to within reason.

The second choice would be to opt for full-screen encoding, which increases the data rate to 4Mb/s, but destroys the ability to see any ATV video (and needs a special TV card).

This seems like a great way to share electronic forms of club information and files. Imagine having an entire, fully navigable club web site fully accessible over the air.

I seem to recall reading about this in the '94 Handbook, but I don't believe I've seen any developmental progress until now. Plus, I think the '94 hbook mentions 9600 baud transfer rates, not 105kb to 4Mb.

Has anyone else thought about this, or am I crazy? :)

Moin,

there is a new user system called "PC/Flexnet for Windows 95" with
drivers for BayCom, scc-cards, dsp-boards and so on.
And AFAIK you can run many programs on top of it (GP).

take a look at http://home.pages.de/~flexnet

Gruss,
Walter

Hi Steve -- there are 2 Mac Software pages for Hams at URL:
http://pw2.netcom.com/~ac6v/pageap.html#MAC
if you haven't seen them -- saw some packet references there.

Timewave Technology (www.timewave.com) announced, as of 15APR97, that
they are in the process of organizing the AEA product line, and will be
selling the current software soon. I'm waiting for this, as I think it
will work better than any shareware out there.

>enable high speed Internet access using unlicensed systems. You can expect
to
>see these systems deployed rapidly as soon as 1998 to provide non-commercial
>and commercial services on these frequencies.
I haven't read that R&O yet but I did read the December one which originally allowed a maximum of 4 Watts ERP on the 5.8 GHz U-NII band, with unlimited *receiver* antenna gain and 1 Watt maximum transmitter power. It sounds as if they just decided that the asymmetry wasn't worth the bother, so you can use one highly-directional antenna for both transmitter and receiver. Makes sense to me.

In typical U-NII service, there will be cellular-style base stations with directional antennas pointing at them. Spectral density is VERY limited: The 1W TPO is actually 50 mW/MHz, so if you're not at least 20 MHz wide, you have to derate power. This tends to reduce interference potential dramatically, especially compared with ham-style narrowband emission.

The U-NII band is one of the best things the FCC has done in years, a real gift to the public, finally a chance to do *something* without being beholden to the "Bell" interests. The h-r-online article is so utterly parochial that it seems like a discussion of World War II that begins with the headline "Church artifacts burned in fire". By opening this band up with VERY loose rules, save for power density, the FCC finally allows the public to have useful access to valuable spectrum! We who have been hams are the most likely ones to know how to use this, but it's certainly not in the antiquarian manner to which the A.R.S. has become accustomed.

Source record: 30216

Need some help:

I have a Kenwood TM-733 Dual Band Radio with the 1200 through 9600 TNC Port. I purchased the special TNC Cable that did not come with proper wiring information. I am trying to wire up to a KPC-9612 Plus TNC.

I have the system working with a cable to the speaker jack and the rest wired to the TNC jack on the front of the radio. This works to a point. The audio from the radio on the TNC jack is not squelched and as such the TNC will not work when this connection is made.

In using the system on TPK - the TNC comes set to NEWUSER MODE. There is no reference to NEWUSE mode in the 9612 manual but there is a supplement for the KPC-3 that states to reset the TNC to HOST or Terminal Mode. HOW?

The TNC will do a connect this way

EXAMPLE:

c al7oo
KD4SMM>AL7OO/1:
c al7oo

and hang.

With others TNC the second and third line do not appear. I cant figure out why or how to stop it.

Any suggestions?

Thanks in advance

2310. Problem with Baycom Packet Modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-04-30 00:00:00 UTC
From: dgravatt@falcon.cc.ukans.edu
Message-ID: <862436746.11947@dejanews.com>
Source record: 30220
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

Hello all,
Got a problem with my Baycom packet modem. I've used it for a couple of years without problems, and then suddenly it started putting out bad QRM on various frequencies, one of which is 145.03, the main local packet spot. The modem itself is generating this interference, and it opens the squelch on my HT. I've checked all of the connections and reseated all the chips. If I remove the AM7910, the QRM stops (not too surprising). Any suggestions? If it turns out I need a new 7910, where could I get one?

Thanks in advance!

- Dan, N2PRC

John WD1V has the canonical Macintosh ham software list at:

http://www.mv.com/ipusers/wd1v/page7.html

Much of the software is available from his site; he has links
to other sites as needed.

Personally, I use NET/Mac, the Macintosh implementation of Phil
Karn's software. It does TCP/IP, AX.25, and NET/ROM.

Steve Jackson (steve@gnosis.slac.com) wrote:
: I just picked up the Hauppauge Wincast/TV card for use with NetMeeting and
: Internet Phone. A couple hams in my club are using it for contacting each
: other and when dialing into other repeaters around the world via the
: Internet. Totally separate from its ability to accept input from a standard
: video source (like a video camera) and reuse it for video conferencing, the
: card can also decode Intercast data that is transmitted in the video
: blanking interval at near-ISDN (105kb) speeds, regardless of the medium
: (air, cable, dss, c-band). The card works under Win95 and Linux (key for
: hams).
:
: How many of us have a 1200 baud TNC laying around collecting dust? It seems
: to me that the best thing to do (on the server side) is to assemble a Linux
: workstation with a 1200-baud TNC for accepting web content requests and a
: VBI encoder/ATV transmitter for transmitting web content. On the receive
: side, you'd need a Linux or Windows PC, a 1200 baud TNC, an ATV
: downconverter (or cable-ready VCR and rabbit ears), and a VBI-compatible
: (and possibly Linux compatible) TV card such as the Wincast.
:
: You'd have two choices for video content, too (remember, this *is* ATV
: after all). You could output normal video like any old ATV repeater and
: watch it in a resizable window on the receiving PC's screens. Or better
: yet, by using a VGA-to-NTSC converter, broadcast an image of the
: controlling PC's console constantly displaying a list of stations currently
: being serviced, kinda like PACSAT.
:
: The second choice would be to opt for full-screen encoding, which increases
: the data rate to 4Mb/s, but destroys the ability to see any ATV video (and
: needs a special TV card).
:
: I seem to recall reading about this in the '94 Handbook, but I don't
: believe I've seen any developmental progress until now. Plus, I think the
: '94 hbook mentions 9600 baud transfer rates, not 105kb to 4Mb.
:
: Has anyone else thought about this, or am I crazy? :)
:
: Steve
: n3vzl

Steve,

You're definately not crazy, I have thought alot about doing something like
this. I never really though about web pages or anything, but I've thought
about sending data across on ATV cause I have a 23cm FM-ATV transmitter
and the bandwidth is large enough to get descent transfer rates, at least

to me :) Maybe one of these days when I graduate and get a real job ;)

TTYL,
Mike --- N3YPA

There is Virtuoso. I would call it OK, but not great.

Personally, I don't touch the "packet programs" but prefer a really good terminal program like White Knight. ZTerm is ok, but not as good as WK, in my book.

I have tried MacRatt but, sorry, I was underwhelmed.

Jim, KA7EHK

If you need a dsp unit solely for removing people keying up on SSB,
or if you work a lot of cw, and don't have a cw filter in the rig, the
Radio Shack DSP may be of use. The filter works better, but it's
better than nothing. Otherwise, it's an audio amplifier with extra
buttons.

Incidentally, there is one other use, and that's to remove the sound
of key clicks on cw. -art clemons-

Mike,

I assume you are talking about the DSP-40?

The *only* thing the RS DSP is good for is CW. It does not reduce noise significantly. It also does not do any digital modes. Unless you want to use it for CW, I would suggest not wasting your money.

I have tried several and my favourite is the JPS NIR-12 followed by the W9GR DSP III.

73 de VE7MDL ....Erik.

>
>Under terms of the Report and Order in ET Docket 96-8, released April 10,
1997,
>the FCC has announced that it will allow high gain antennas
>for unlicensed transmitters operating in the 2400 and 5800 MHz
>Part 15 allocations. These bands are shared with the Amateur Radio Service.

I read the R&O, as well as the original NPRM, last night. The FCC has a pretty decent web site, though posting Word Perfect files and their ASCII output is not quite the same as HTML-izing.

>Under the new rules, very high gain antennas may be deployed at 2400 and
>5800 MHz. Certain transmitter power reduction restrictions apply at 2400 MHz
>but unlimited gain systems may be installed at 5800 MHz. These systems will
>enable high speed Internet access using unlicensed systems. You can expect
to
>see these systems deployed rapidly as soon as 1998 to provide non-commercial
>and commercial services on these frequencies.

To clarify: Very high gain antennas may be used in the 5800 MHz band but ONLY for "point to point" operation, such as wireless T1 links. Point to multipoint (access systems, pseudo-cellular, etc.) and sectorized (a bunch of directional antennas in a circle) systems are explicitly prohibited from using unlimited ERP; such systems are still limited to 4W ERP, and have to derate their transmitter power dB for dB when antenna gain goes up.

At 2400, it's 1 dB TPO reduction per 3 dB antenna gain increase.

These bands are ONLY for spread-spectrum use. Narrowband is prohibited at such power levels via spectral-density caps; if the bandwidth goes down, the power goes down too. However, frequency hoppers can dwell up to 400 ms on a sigle frequency, which can create noticeable interference to some kinds of narrowband operation. Direct-spread systems have no such effects.

The R&O actually makes a halfway decent primer on spread spectrum, in part because it discusses (and provides) new, clarified definitions for some of the terminology!

When I read these recent FCC rules, dollar signs swell in front of my eyes. Nice ones, not the boodlesque kind that so many govt. decisions display. Somebody is going to make money on this stuff. I wish I had the resources. Oh well -- anybody want to hire us for a consulting engagement? :-)

I bought a RadioShack DSP right after Christmas, it was on
"close out" for $9.95 and even at that price I had the option
of returning it if I did not like it.
It does a great job of removing single frequency (1 tone)
interference. As an examble, by tuning to 10.0Mc, the DSP
completly removes the audio tone(440CPS at that moment).
I could clearly hear a woman speaking spanish underneath WWV.
On the otherhand, it does not do much in the way of removing
QRN (lightning crashes), or other "wideband crud".
For the price it does a good job.

I don't think you are crazy, Steve, you sound like you are keeping up with technology. But I have a question. I think the internet is great. Great way to waste time, sometimes a great way to find information. Great way to keep in touch with people via email. Great way for me to hook my cluster node to the cluster in the U.S.

What I don't understand is this, maybe you could explain it to me. I don't understand the fascination with ways to hook the internet to the radio. I don't know why a lot of people are trying to figure out how to download web pages from a packet BBS. A website for a ham club that is accessible over the radio just strikes me as a really wierd idea. Don't get me wrong, I think the internet is a great tooI to use in conjunction WITH ham radio, but I'm perfectly happy having the computer next to my HF rig connected to the telephone. I live in a very low tech enviornment on a little island. But I don't know any hams who don't have a computer. And I can't think of too many hams I know who don't have an internet account. Matter of fact, people I talk to on HF lately have been asking me if I have a web page, hard to find hams any more that don't.

If your answer is that you are just interested in fiddling with the technology and making it work, I understand completely. Been there, done that. Had lots of fun putting together all the hardware to use the digital satellites - got it done and found the content made it a total waste of time, but I still had fun making it work.

But do we really need to make the internet go flying around the neighborhood on ham frequencies, or can't we just keep dialing in to it on the telephone ? And if we do get it flying around on VHF, when some guy connects to his favorite porno site, who gets the pink slip, him or the guy running the BBS ?

Hank Oredson <hank_oredson@mentorg.com> wrote:

>Last night, I telnetted to a commercial ISP via kb6le-3 in the Seattle
>area.
>The first thing I saw on my screen was an advertisement for the
>services of that ISP. Clearly business use of ham radio.

No, I don't think that is clearly business use of ham radio. Unless, that is, KB6LE owns the ISP. It's clearly the same as ordering a pizza on the repeater. The business rules say I can't use ham radio for MY business, i.e., I can't use the radio to engage in any form of business from which I make money. Read BUSINESS. I can sell my ham gear, because I am not in the BUSINESS of selling ham gear. But I can't sell ham gear if I own a radio store.

The FCC has already said I can use ham radio for the Pizza Man's business. So it would appear to me that any telnet connections you can find where you can SPEND money are not a violation of the rules, unless, again, the ham who provides you with the telnet access is making money from you spending it. If KB6LE owns the ISP you saw the add for, and you sign up for internet services with that ISP, via your telnet connection, you aren't violating any business rules, KB6LE is.

>There were several such connections available to me, including a couple
>ISPs, and the TAPR business site.

If you have telnet privledges, there are probably thousands of connections available to you. What escapes me, in following this discussion, is WHY anyone on packet would want to use a TCP/IP gateway for internet access. Maybe to telnet to another BBS and leave a message for another ham, or telnet to a DX cluster if local cluster access is not available, but as slow as the internet is when I connect with a modem to an ISP, I sure don't have much use for a 1200 or 9600 baud packet connection to the internet.

I think this discussion arouse when someone did something on a BBS that 'upset' the owner of the BBS. Maybe the key thing to remember is that when you are connected to a BBS, the rules are open to interpretaion by the person who owns the BBS, so it's best to play by his rules. If you don't like his rules, go play elsewhere. If you connected to my BBS and did something which was a violation of the rules, I would say it's my fault for not setting the BBS up so you couldn't do it, not your fault for doing it, but I doubt everyone who runs a BBS thinks that way.

73, Jim KH2D

:>

Kantronics will say it's not, but I beg to differ. I had exactly the same problem about a year ago. A year before that, the "ex" sysop in this area also had the trouble. He called Kantronics and they sent him a "replacement" eeprom. I tried the same thing and they (Kantr) said there is no replacement and then said I would have to buy the latest upgrade.

Needless to say, an eeprom burner comes in handy, hi hi!!
(Can't imagine this will break any copyrights, as Kantronics said it doesn't exsist anyway!!)

Where does one get the equipment to do this? When I checked into 56Kbps
about two years ago, all that I could find was GRAPES. It required both
a transverter and an amplifier to work over the 7 miles that I needed.
I couldn't find an appropriate combination to suit these parameters.
The 2 Mbps link required that I etch and assemble my own board. If this
stuff is available, please let us know where.

Unfortunately, the market for this stuff isn't large enough in the amateur
community to attract the manufacturers. My hope is that the U-NII bands
will create the market. 20 Mbps is nothing to sneeze at. Plus, on this
usage is FCC Part 15 so there are no usage restrictions. But with 1 W
maximum PEP and antennas limited to 6 dbi gain, there will be distance
limits. But in metropolitain areas the amateurs will be able to set up
networks (like the packet networks today) to effectively bypass distance
limits in the network area.

2338. South East MO & Region Packet Operators

Hello, Folks:

I have a few ideas floating around and I would like to hear from
Packet Operators (including NodeOps and SysOps!) in the South East MO
and nearby areas.

(sorry, but my ISP would not accept limited distribution fields!)

Please respond via E-Mail to keep the fluff in the newsgroup and mail
lists down.

Thanks!

2340. 4800 Baud?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-01 00:00:00 UTC
From: John Welton <John_Welton@unc.edu>
Message-ID: <01bc5659$c27a3c00$d5e70298@JWELTON.UNCH.UNC.EDU>
Source record: 30250

It seems we've made a jump from 1200 Baud packet to 9600 Baud. Yet 9600 requires quite a bit of technical skill to get everything right - often a new radio. But 4800 can, from what I understand, squeeze through the audio pass band and so could just interface to the radio like any 1200 Baud TNC.

Is this correct? If so, why not move to 4800 first then 9600? Seems a choice to go to 4800 with conventional equipment would be appealling rather than buying new equipment that _might_ work at 9600.

Am I missing something here.

John

: know why a lot of people are trying to figure out how to download web pages from

If a not-yet-a-ham can interject here, I will put my foot in my mouth and try to explain.

Most hams I know have both a base and handheld/portable radio. Why? Can't they just talk from home? Why isn't that good enough? Well, we all know the answer to that question. I think it is the same for access to the worlds greatest database of information ever built! I am not just happy getting to the internet fromhome. I want to be able to lean over to my wife in the car and have her turn on the laptop and look something up for me. I want to visit my family members who do not have internet access, and still get to the internet and look something up.

So far, my quest for information on remote access to computer networks has not found a great internet access method. I have found some 38.4 radio modems that only work at a couple hundred feet. But to get anywhere around town, pushes that down to 9.6 or worse. For realistic baud rates that can utilize the WWW will take some jumps/leaps in technology.

If we all just say "Why do this?" Then it will never happen. It was Dave Thomas who said "If we build it, they will come." Well, he may not have been the first, but he was the latest! This is the same thing. If somebody makes a fast packet radio connection to the internet, a good use for it will follow.

I have been told that cellular (can I talk about that in this group?) is a better solution for remote computer access. Well, I would agree with that in commercial terms. But for those of us who have computers as a hobby also, The two just make total sense. I mean, why pay for a cellular connection, when I can use both the computer and the radio to get the same thing.

Of course, as you mentioned, the satisfaction of saying, I did that, has value too. :)

I would not say that I can not live without it. I just want to do this because it makes sense. I have many times considered getting a ticket so I could communicate with friends, but never have. Now that I can justify it by having two hobbies that naturally work toghther, it has given me more motivation to get that operators

license.

Thanks for reading.

2343. BPQ + HF

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-01 00:00:00 UTC
From: skoric@fon.fon.bg.ac.YU
Message-ID: <9705020104.aa22060@fon.fon.bg.ac.yu>
Source record: 30253

Hello folks,

Here you have a couple of questions to answer. Tnx in advance!

1. I run FBB5.15c software on PC286 clone, TNC2S/WA8DED, FT-7B and dipole for 20m only. It works ok. In the TNC I also have TAPR firmware. For years I ran the software on VHF too. Beside the DED host mode, I ran TAPR + KISS mode with BPQ4.07a switch. On VHF everything was fine with BPQ, but now on HF a strange thing happens: the TNC usualy tries to go sending even there is signal on receive (DCD lite is on). In DED host mode is ok. I used the same BPQ configuration for HF as it was on VHF. Is there any solution to solve this problem?

2. I plan to install another HF port on 20m too. Wonder if it is possible to run 2 HF rigs simultanously on the same band (of course, not on the same qrg)? May I expect some RFI problems in that case? How much should two antennas to be separated to avoid troubles? Finally, is it better in that case to use separate COM ports, or the existing one with a diode matrix? At the moment, I have only one (COM1) port for TNC and internal phone modem defined as COM4 for link to another FBB bbs that is running on VHF.

3. I also plan to install TheNet firmware, instead of TAPR/KISS, if both previous problems are solved... and to have an HF-HF gateway, for example. Where is BPQ better in use: in NETROM mode or in KISS mode?

4. I've read somewhere that has been produced node software intended for protected backbone applications and equipped with a "positive" list up to 4 stations that are allowed to connect FROM that node. A non-listed station may connect to it, but is not allowed to connect FROM it, short of disconnecting. We in YU may find such firmware very interesting to protect some overloaded nodes for the safe forwarding on VHF, for example. I need

more info about.

Hope to get some advices... you don't need to answer all questions, hi!

What firmware version is given in the sign-on message? Anything about
1.2.4 or later should have KISS (I'm not exactly sure of the first
version that had it.).

If you DO have KISS, Use the command "kiss on" followed by "restart".
The LEDs should blink 2 or 3 times (depending on how much SRAM you have)
and you will be in KISS mode.

Bob

Yes, 1270s normally support KISS.

the command is typically KISS ON. Then, you have to reset it to take effect.

But, beware. It is VERY hard to get out of KISS mode unless you use something like one of the NOS variants!

John -

The real break comes between 2400 baud and 4800. At 2400, you can use AFSK like 1200 and use the mike and speaker jacks of almost any radio.

As soon as you go to 4800, everything changes. While bandwidth occupied by 4800 baud is not very wide (actually, 9600 baud takes no more than 1200 AFSK!), that is not the real issue. You cannot use AFSK at 4800 because the bits do not last long enough for enough of a tone to be reliably detected. Think about it: 4800 baud is just over 2ms per bit. That is just long enough for 1, count-em, 1 cycle of a 2400 hz tone. So, at 4800 baud, you are forced to use FSK or one of the other modulation schemes like PSK.

The common feeling seems to be that 9600 and 4800 are almost identical technically (same radio requirements, etc), so why bother with 4800 because nothing is any easier.

Jim, KA7EHK

We did that, John. It was called the HAPN modem. It wasn't as "plug and play"
as 1200 baud, but it was a bit easier than 9600 baud. The problem was the
same one that killed the 2400 baud Kantronics modem. That problem was
that the speed up wasn't significant enough. With the TR delays and protocol
overhead, 2400 wasn't 2x 1200 baud. In fact it only worked out to be about
1.2x 1200 baud in effective throughput, and that wasn't worth being incompatible
and being tied to one manufacturer's proprietary TNC. The HAPN modem offered
more, but it wasn't 4x 1200 baud either. Only when we go to 9600 baud do we see
a *significant* speedup over 1200 baud operation, and a significant part of that
is due to the radio choices which give us faster TR turnaround. A good radio for
9600 baud will have a TR time of 4 mS while most FM voice radios have a TR
time on the order of 400 mS. That makes a huge difference in throughput on
a busy simplex LAN. (Much of that speedup is the result of *not* using a
synthesizer, which is anathema for 9600 baud modulations.)

Our longest hop in our 56 kb network is about 90 km, and we haven't found
an amplifier necessary. We use the MMT432S transverters from Microwave
Modules for most of our sites. These units are rated at 10 watts output, but
we have to turn them down to about 4 watts to maintain linearity. Down East
Microwave and SSB Electronics are alternatives for the transverter. The
SSB Electronics units are rated at 20 watts, and you can actually run them
at 20 watts and maintain linearity. This is more power than you are likely
to need, however. The RF modem itself is no longer available as a kit from
GRAPES, but PacComm now produces a wired and tested version ready
to "plug and play". They also sell the Gracilis PacketTwin board for your
bit interface.

Faster stuff does require you to do a bit of building, but hey, this is amateur
radio, that's what we do.

The FCC just authorized unlimited ERP for operation in the 5 GHz U-NII band. That allows long range hops (at least 50 km between reasonable sites).

>of years without problems, and then suddenly it started putting out bad
>QRM on various frequencies
>- Dan, N2PRC
>
>dgravatt@falcon.cc.ukans.edu

Hi Dan..
First thing I'd check is the circuit grounds. Look for any wires
that may have come loose, and check for dry joints. Aslo check the sheilding
of your cables to and from the modem. The only other thing I can think of is
maybe parasitic oscillations from the oscillator? Grounding the metal case
of the 2 MHz xtal can sometimes cure this.
The AM7910 modem is usually very quiet when it comes to RF noise so
somethimg is surly astray. Have you tried checking the interference with the
computer off and just the modem on? This would be a good idea if you
haven't, otherwise it may not be the modem at all!

Hope I've been some help..

Best regards de Graeme.....

Jim, I wrote a dos program to handle turning KISS on and off on various
tnc models. ftp://pc.usl.edu/pub/ham/kissit10.zip is the URL. C code is also
provided in the archive.

No, hard feelings but are you sure this $700 , doesn't look that extreme? I was offered a 486, with a Floppy 3.5" and 1.08G of hard disk plus a 15" colored monitor for $800, three months ago, the computer is new and never used, but I thought that it's expensive a bit!

I agree all of us pay a lot when we bye a computer, but beleive me it's not worth nearly as much after one day of usage! I say check Office Max, I saw a new Compaq Pentuim 133 for $1,199.00

Take care,

Abdullah Al-Molah

>easier to adapt the existing USCC driver, and I'd answer: Why me, I'm not
>interested in having a driver for this card and I'm not willing to spend
>the time in testing and debugging.

Then, let me tell you that I wasn't interested at all in a driver for the
USCC card (in my opinion it is not an interesting card because of the two
fixed lowspeed modems on it, and because of a timing glitch which causes
trouble in certain systems).
However, people asked me to support it in NET and I happily added the
required support code and a documentation entry. I think it is good ham
spirit to do so.

It does not seem unreasonable to me to request the same small effort from
others maintaining SCC drivers. In fact, I am not interested in a PA0HZP
SCC driver for Flexnet myself, but I see others requesting it on the BBS
network and getting a negative response all the time. Most of these people
are not capable of writing the driver themselves, even when given a DDK
and a working driver for another environment.

>> I think the non-availability of a driver for this card at least has some
>> unpleasant smell around it.

>(*cough*) Open the window then, take a breath. This will help you more
>than posting annoying articles into this group.

Again, I am not helped by another SCC driver, but I merely climb the
soapbox for others who have been requesting it many times.

I would be interested in a Flexnet implementation for Linux, but of
course it cannot be created using the published programs and development
kits. Or maybe it can, but it would probably require work everytime a
new version is released.
(hey, it would even solve the driver problem as Linux of course supports
all SCC cards, including the USCC)

>more, but it wasn't 4x 1200 baud either.

The HAPN modem is very popular over here. It does not offer 4x 1200 baud,
but when used on transceivers unsuitable for 9600 baud it often offers
more throughput than a G3RUH-type modem, especially when lazy timings are
used (e.g. when using TCP/IP). This is because a single missed packet often
results in a long re-transmission delay, and thus a lot of lost time in
which a lower-speed (but lower bit-error-rate) modem would have sent a lot
of data.

I think it *does* provide a significant speed increase over 1200 baud.

kh2d@kuentos.guam.net (Jim Kehler) writes:

> I don't understand the fascination with ways to hook the
> internet to the radio.

I used to use by HP100LX, KPC-9612, and FT41-R at the beach to read mail from my Internet-connected host at home. Occasionally I would use the UNIX 'talk' command in the same environment to chat across the Internet with friends who were at work. I once got some help putting up a borrowed tent in the middle of nowhere this way by contacting the tents owner at the office, where he was burning a little midnight oil.

Just off the top of my head, I can think of several other potentially interesting projects that involve connecting a radio to the net. At one company for which I worked, we considered linking repeaters at multiple locations over the net; there is now an off the shelf way of doing this using commonly available net-based telephony software. One might extend this to video conferencing, mixing ATV on the radio side with software like CU-SeeMe on the Internet side.

> I don't know why a lot of people are trying to figure out
> how to download web pages from a packet BBS.

The answer to this one seems pretty obvious to me: the graphical user interface of the web is vastly superior to that of your typical packet BBS. Personally, given the choice between point-and-click versus keystroke command lines, I'll take the former. Similarly, given the choice between reading nicely rendered helvetica text versus ragged-edged courier, I'll take the former again.

> A website for a ham club that is accessible over the
> radio just strikes me as a really wierd idea.

I'll grant you that a packet-based web site is no place for a 20K JPEG picture of one's shack, or a 50Kb GIF image of the ARRL logo -- at least not at 1200 bps. (Why hams aren't running at more usable transmission rates is another discussion.) This, however, is a matter of sensible page design, and is not an argument against using an HTTP/HTML-based server on packet.

> I'm perfectly happy having the computer next to my HF rig
> connected to the telephone.

If you're happy to use the telephone to access the local ham club's web site, then why not contact local hams on the phone, too, rather than the repeater? I'm really not trying to be a smart ass here; it just seems like a logical extension to me.

> If your answer is that you are just interested in fiddling with
> the technology and making it work, I understand completely.

Certainly this is a significant factor. For my part, a lot of the fun in ham radio is doing things simply because they can be done. I can call South Africa by phone any time I wish, but it just ain't as much fun as doing it on HF. When I read e-mail at the beach with my little "pocket packet" station, it's not as fast as my buddy's laptop and Metricom RF modem, but it's a lot cheaper and a lot more satisfying. I can chit chat on my cellphone any time I want, but it just isn't the same as ragchewing on the local repeater.

What *I* can't understand (and this is not directed to Jim, but to others who have posted on the topic in the past) is why some folks get so bent out of shape at the very concept of a radio/Internet interface. IMHO, I think it would be pretty neat to connect AMPRnet segments over the Internet using IP encapsulation, or to make an ordinary packet BBS in Australia available to local folks using AX.25 encapsulation. According to some of the regulars on this newsgroup (and some of the more respectable ones at that), such practices will hasten the demise of ham radio as we know it. Quite frankly, I just don't get it.

Todd, KB6JXT

Hello everyone:

Apologies for using the APRS SIG list for this purpose, but I am selling
my 386 computer (the very one I'm using right now) in order to upgrade to
a better (not to mention more modern) system.

It has the following:

* 40 Megabyte scuzzy HD (not yet installed) with matching motherboard
* 14.4 USRobotics external modem with cable
* 2 floppy drives (5 1/4")

Will sell as PACKAGE DEAL ONLY!!! Asking price: $700

If interested, email me at patcook@dimensional.com

I look forward to your reply....

Patrick Cook
patcook@dimensional.com
Denver, Colorado

Unfortunately, the AM7910 modems have all been tremendous noise
generators, often landing right on the desired frequency. You might try
2 or 3 different crystals in the board to see if the noise will migrate
away from your desired frequency. The AM7910 and internal clock
circuitry generate lots of noise no matter what you do but hopefully you
can move it sufficiently to find a usable "hole" in the noise output.
Interestingly, the "earlier" modems using XR2211/ XR2206 IC circuitry
are relatively clean from such aggravations, mainly since they use no
internal oscillators etc. with which to generate spurs of noise up and
down the spectrum.

In article <33697206.2309@proaxis.com>, Jim Wagner <wagnerj@proaxis.com>
writes:

>
>the command is typically KISS ON. Then, you have to reset it to take
>effect.
>
>But, beware. It is VERY hard to get out of KISS mode unless you use
>something like one of the NOS variants!
>
>Jim, KA7EHK

First, the sequence for an MFJ 1270 is

Kiss ON <Enter>
Then
Restart <Enter>

Typing reset destroys all of the parameters stored, and causes the
MFJ to do a hard reset. It won't ever get into Kiss Mode that way

One other way that used to work with early 1270's but may not any
more, is to try Kiss On, <Enter>

Then turn the 1270 off, wait about 5 seconds and turn it back on.

As I said, I don't know if that still works.

The 1270 is not particularly difficult to get out of kiss mode without
NOS.

All one has to do is send the following sequence from an msdos machine
While holding the <Alt> key down
<Alt> 192
Release <Alt>
Hold Alt Key down
<Alt> 255
Release <Alt>. then press & hold the <Alt> key again,
<Alt> 192

The above numbers must be typed on the numeric keypad of an msdos
machine, but it does work reliably from every terminal program I've tried.

I've also successfully used a TRS 80 Model 100, a Tandy Color Computer,
and MACs to send the equivalent of Chr$(192), Chr$(255), Chr$(192) and
the equivalent can be done by writing to the serial port with an Msdos or
Linux computer also. In fact that's how various flavors of Nos do the
dirty deed. If Nos can get a TNC out of Kiss mode with param ax0 255,

then the above
commands also work. There were some MFJ TNCs which required an additional
param ax0 254, if I remember correctly, but that 254 is trying to
remember something I haven't used in six years or so. -art clemons-

Patrick, your price is MUCH too high - by at least 50%. Brand new 486 machines
can be purchased for $700.

2372. $$ BECOME RICH SOON $$ PLEASE READ THIS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-03 00:00:00 UTC
From: "Walter J. Thomas" <aag01@hotmail.com>
Message-ID: <5ke11o$gi0@news.skyweb.net>
Source record: 30332

Subject: $$$$: BECOME RICH SOON !!

Dear reader,

PLEASE TAKE A MINUTE TO READ THIS, I'M RICH NOW AND YOU CAN BECOME TOO!

YOU CAN START YOUR OWN INTERNET BUSINESS IN YOUR SPARE TIME!!!

As you know the internet is growing at a tremendous rate. And
I'm sure you realize that millions of dollars are exchanged
for goods and services on the internet each day. Have you ever
said to yourself "I would like to use my computer too make
money" (or to make more money)??
WELL YOU CAN AND WILL MAKE THOUSANDS OF DOLLARS QUICKLY AND
EASILY IF YOU FOLLOW THESE SIMPLE INSTRUCTIONS!!!
The Business program outlined below is a simplified form of
E-mail marketing. Do not take this opportunity lightly, it is a
powerful tool that will allow you to have your own business
and start you on the path to financial freedom.

I KNOW THIS BUSINESS WORKS!! IT HAS WORKED FOR ME AND IT WILL
WORK FOR YOU. By the time you receive this business plan there
is a good chance that I will have been removed from the system.
But thats ok because I have already made a tremendous amount of
money using this system, and I would like to see your life change
as much as mine has. There is nothing more rewarding than
knowing that I have helped many good and honest people enrich
their lives. Follow the instructions listed below EXACTLY and
you will be on your way. Good Luck, and share the wealth.

Sincerely,
Walter J. Thomas

STEP1).
Get 5 pieces of 8.5"x11" paper and write:
"Please add me to your information mailing list"
Now take 5 $1 bills and fold $1 inside each piece of paper.
Place the request and money in 5 seperate envelopes and seal.
Carefully address the envelopes with the 5 addresses provided
below.(Be sure to include a return address and a stamp!)
Now mail the requests In a timely manner.

#1) Shari Davis; 1635 Manning Way; Colorado Springs, CO. 80919

#2) Gene Propp; 5121 W. 72nd Street; Praire village, KS. 66208

#3) Steve Wrubel; 3234 Nebraska Place; Costa Mesa, CA. 92626

#4) Rene van Ratingen; Akker 2 ; 6093 EJ ; Heythuysen ; Netherlands

#5) Walter J. Thomas; 244 5th Ave, 2nd Floor, New York NY, 10001

STEP2).
Copy this entire business plan and make the following changes:
Remove the #1 name off the list.
Place your name in the #5 position and move the other 4 names up. (#5moves to#4, #4moves to#3, #3moves to#2, #2moves to#1)
Your name is now the bottom of the list.

STEP3).
POST THIS ARTICLE ON AT LEAST 200 NEWSGROUPS!!!!!!!
E-MAIL THIS ARTICLE TO EVERYONE YOU CAN!!!!!!!
IMPORTANT NOTE: You MUST post this article to AT LEAST 200 newsgroups. There are about 45,000 newsgroups, with more being added every day. Each time you post on a newsgroup your message will be seen by many different people.
You should send this article via E-mail to as many people as possible. E-mail addresses are available for free through many sources on the internet. You can also purchase E-mail lists from several companies for a very small fee.
Remember it's your business and the more places you send it to, the better your chances of success! (I highly recommend that you send it out to more than 200 places).
REMEMBER TO PUT A CATCHY PHRASE IN THE SUBJECT BOX.

CONGRATULATIONS YOU HAVE JUST JOINED A GROUP OF ENTREPRENEURS!

Let me review why this works.....
Send out 200 articles and with a 5% response you get $10.
Those 10 people send out 200 and at 5% you get $100.
Those 100 people send out 200 and at 5% you get $1000.
Those 1000 people send out 200 and at 5% you get $10,000.
Those 10,000 people send out 200 and at 5% you get $100,000.
EVERYDAY THOUSANDS OF PEOPLE JOIN THE INTERNET!!!!!!!!!!

The above example is a perfect case scenerio. The response rate varies typically from 2% to 10%. To increase your success rate I suggest that you post this article to AT LEAST 200 newsgroups and send it to as many individuals as possible. Remember many people will see this article when it is posted on a newsgroup!! Also note that many of the people you send it to are likely to send it out to more than 200 newsgroups and people.

You don't have to retype this article every time you send it, just follow the instructions below and you will see just how easy this business is. If you follow these simple instructions there is no way you can lose. Every day several thousands of people get on the internet. Don't delay start today, you'll be glad you did!!!!!!!!!!!!!!!!!

POSTING TO NEWSGROUPS USING NETSCAPE:
1) Click on any newsgroup, like normal.

Then click on to " To News" in the top left corner of the
Newsgroups page. This will bring up a message box.
2) Fill in the subject box with a catchy phrase such as:
$$$FAST CASH$$$, ARE YOU THE PERSON WHO..., or the like.
3) Now go to the message part of the box and retype this letter
exactly as it is here. (The only thing you change is adding
your name in the #5 position and moving the other addresses
up 1 position each, thus removing the #1 name).
4) When you are done typing in the WHOLE letter, click on "File"
above the send button, then "Save as..." DO NOT SEND YOUR
LETTER UNTIL YOU SAVE IT!!(this is so you only have to type
this once).
5) Now that you have saved the letter, go ahead and send your
First copy!(click the send button in the top left corner).
6) THIS IS WHERE YOU POST AT LEAST 200 TIMES!!! OK, go to any
newsgroup article and click the "To News" button. Type in
Your catchy phrase in the SUBJECT BOX, then go to the body
part of the message box and place your cursor there.
NOW click on "Attachment" which is right below the SUBJECT BOX.
Click on "attach file", then find the letter you saved, click
once on your saved file, then click "Open", Then click "OK".
If you did this right, you should see your filename in the
attachment box and it will be shaded.
NOW POST AWAY!!!!!!!!!!!!!!!!!!!!!!!!!!!!

IF YOU ARE USING INTERNET EXPLORER:
1) Its just as easy, Holding down the left mouse button,
highlight this entire article, then press the the "CTRL" key
and the "C" key at the same time to copy this letter.
2) Now go to the newsgroups and press "POST AN ARTICLE", Type in
your catchy phrase in the subject box, and click the large
window below. Press "CTRL" and "V" and the article will
appear in the message window. **BE SURE TO MAKE YOUR ADDRESS
CHANGES TO THE 5 NAMES**
3) Now re-highlight the letter and RE-COPY it so you have the
changes...Then all you have to do for each newsgroup is
press "CTRL" and "V" and press "POST" it's that easy!!!!!

Thats it ! All you have to do is jump to different newsgroups
and post away. For both methods it only takes about 30 seconds
to post to each newsgroup. Once you get the hang of it.

REMEMBER THE MORE NEWSGROUPS YOU POST TO THE MORE MONEY YOU MAKE!!
YOU MUST POST TO A MINIMUM OF 200 NEWSGROUPS!!!!!!!!!!!!!!

You should start receiving replies within a week or so (sometimes
they come within days)

BE SURE TO SEND OUT $1 TO THE PEOPLE ON THE LIST PROMPTLY!!!!!!!!!

PERSISTENCE AND HONESTY WILL REAP YOU HUGE REWARDS!!!!!!!!!!!!!

DO NOT TO LET THIS OPPORTUNITY PASS YOU BY!!!!!!!!!!!!!!!!

FOR JUST $5 YOU CAN CHANGE YOUR LIFE!!!!!!!!!!!!!!!

REMEMBER: THE PERSON WHO DARES NOTHING, NEED NOT HOPE FOR ANYTHING.

Eimac type YC156. This is the same basic tube as a 4CX5000. It is a high mu triode with beam forming cathode and grid that provides the gain of a tetrode. Power gain is 15 db.It was designed for the medical industry and has a rating of 6500 volts at 4 amps (67 amps peak in pulse mode !) This tube will operate with full output to 110 Mc. No socket is necessary for this tube, it will mount in a 3 1/2 inch diameter clear hole, and the grid ring will bolt to the chassis. Height overall is 8". I have all data sheets. Tubes are used but emission is guaranteed for full output. $325 each.

Hi, I have for sale a Packet Node. It consist of an MFJ-1274
TNC converted with the X-1J4 epprom. The Radio is a Motorola
Maxar crystal controlled radio. It has the interface cable out
the back to hook to the TNC. It is crystaled for 145.770
I'll take $200. for the complete setup. E-mail me at the
address below if interested.

Those who object to substituting the internet for a long haul amateur packet backbone do so because it reduces the incentive to nil for amateurs to actually implement a long haul amateur packet backbone. That in turn leaves the amateur network dependent on the wired network in times of emergency. Thus the amateur network doesn't serve its purpose as a separate backup system to the commercial networks.

I think this is a valid complaint. OTOH, having the ability to interconnect with the wired network offers benefits as well. Ideally, we want *both*, but I'm afraid amateurs won't work toward an independent amateur backbone if they have the easy option of just connecting to the internet.

>I think it *does* provide a significant speed increase over 1200 baud.

I guess that's a function of what you consider "significant". I tend to consider as significant changes of an order of magnitude or more, IE a 10x or better improvement. The jump from 1200 to 9600 is roughly on that order, and is worth expending considerable effort to achieve. 56kb with a 47x speed increase is even more significant of course. :-)

Use of the HAPN modem does require a bit more effort than "plug and play", and does require that you organize an effort by others to upgrade as well, and really requires you to coordinate another channel since 1200 and 4800 baud modems don't coexist well. If you're going to do all that, you might as well expend a little more effort and go 9600 baud.

I suppose that if you can *easily* get all your local users to switch from 1200 baud to 4800 baud, it would be worthwhile. As long as the manufacturers include a 1200 baud modem in their TNCs, however, I don't think you can really abandon 1200 baud completely. So if you have to maintain a 1200 baud service, it doesn't make sense to uprate your second service to only 4800 baud when you can do better for a little more effort.

>might be helpful?

The old Mod 100 makes an adequate portable packet terminal. You can use
the built in telcom application to talk to any TNC (MFJ, Kantronics, PacComm,
etc). There are a couple of drawbacks. The 40 col display is a pain when reading
text formatted for 80 cols, and the serial link is not fast. You may drop characters
if you run it faster than 1200 baud. (You could write your own serial handler to
speed it up, but it probably isn't worth the effort.)

2381. [TAPR-BB:345] TAPR Update for Dayton Hamvention

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-03 00:00:00 UTC
From: Steve Stroh <strohs@halcyon.com>
Message-ID: <Pine.ULT.3.96.970503192357.12930A-100000@chinook.halcyon.com>
Source record: 30341

Just a reminder that TAPR is doing a lot of things at Dayton and everyone is invited to attend and participate!

Full details are available at http://www.tapr.org/tapr/html/dayton.html with maps, schedules, and some other goodies. If you need a text version of the information, just e-mail tapr@tapr.org

Friday is the main day of activity with the all day TAPR Digital Forum and then that Friday night for the annual PacketBASH and TAPR Banquet. The Banquet will be hosted again by the Miami Valley FM Association at the NCR facility a few minutes south of Dayton. Tom Clark, W3IWI will be the after dinner speaker with the topic of "Amateur Radio 2000: A Retrospective View of the Future" . There will also be a prize drawings for those that are attending! Should be a fun evening if you don't have anything planned for Friday evening.

TAPR will also be providing live audio from Dayton on both Friday and Saturday. If all goes well, the entire TAPR Digital Forum will be availble on our web site http://www.tapr.org for listening to using RealAudio as the forum happens. The radio link between the forum room and the TAPR booth (where the Internet connection is) is planned to be over a high-speed SS radio link, but you never know how a radio is going to handle Dayton :-)
On Saturday, TAPR is providing live audio from the the Open Ham Radio Town Meeting from 3 - 5 PM EST (Room 5) forum host is Len Winkler, KB7LPW (http://www.tapr.org/newsline/townmeeting.html). Check the web page to see the schedule and topics for the session.

The TAPR Digital Forum kicks off at 1pm on Friday and there is a lot on Spread Spectrum communications this year!!

Friday Forum Schedule (May 16th)
1:00 - 1:45pm (45 min)
* Introduction to Spread Spectrum Communications
Steve Bible, N7HPR

1:45 - 2:00pm (15min)
* Update on TAPR Activity
Greg Jones, WD5IVD and Steve Stroh, N8GNJ

2:00pm - 2:40pm (40 min)
* Building TCP/IP Networks in the Amateur Radio Community
John Ackermann, AG9V, Allan Finne, KB5SQK

2:40pm - 3:00pm (20 min)
* Review of current SS developments
Barry McLarnon, VE3JF, Dewayne Hendricks, WA8DZP

3:00 - 3:20pm (20 min)
* System Design Parameters for Spread Spectrum Systems
Tom McDermott, N5EG

3:20 - 3:40pm (20 min)
* TBA
Phil Karn, KA9Q

3:40 - 4:00pm (20 min)
* TAC-2 (Totally Accurate Clock) GPS Project
Tom Clark, W3IWI

4:00 - 4:20pm (20 min)
* Update on Amateur DSP Activity
Bob Stricklin, N5BRG, Bill Reed, WD0ETZ

4:20 - 5:00pm+
* APRS Update and TAPR APRS SIG Meeting
Bob Bruninga, WB4APR and Keith Sproul, WU2Z

2382. $$$Get Rich Fast$$$

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-03 00:00:00 UTC
From: Ming Leung <jjl@intergate.bc.ca>
Message-ID: <336BE42B.645C@intergate.bc.ca>
Source record: 30342

should've done this sooner! It really does work!!!

A little while back, I was browsing these newsgroups, just
like you are now, and came across an article similar to
This that said you could make thousands of dollars within
weeks with only an initial investment of $5.00! So I
thought,"Yeah, right, this must be a scam",but like most of
us, but I was curious, so I kept reading. Anyway, it said
that you send $1.00 to each of the 5 names and address
stated in the article. You then place your own name and
address in the bottom of the list at #5, and post the
article in at least 200 newsgroups.(There are thousands) No
catch, that was it.

So after thinking it over, and talking to a few people
first, I thought about trying it. I figured what have I got
to lose except 5 stamps and $5.00, right?

Like most of us I was a little skeptical and a little
worried about the legal aspects of it all. So I checked it
out with the U.S. Post Office (1-800-725-2161)and they
confirmed that it is indeed legal!

I told my friend about it. Since she's a lot more adventurous than I,
she
tried it first.

Well GUESS WHAT!!... with in 7 days, she started getting
money in the mail! I was shocked! I still figured it would
end soon, and didn't give it another thought. But the money
just kept coming in. In her first week, she made about $20.00
to $30.00 dollars. By the end of the second week she had made
a total of over $1,000.00!!!!!! In the third weekshe had
over $10,000.00 and its still growing. This is now her
fourth week and she says she has made a total of just over
$42,000.00
and its still coming in ....

So with that I've given it a try. This is now my first week & Im
very
encouraged! I should've done this a lot sooner!!!!

Its certainly worth $5.00, and 5 stamps, I spent more than
that on the lottery!!

Let me tell you how this works and most importantly, Why
it works....also, make sure you print a copy of this

article NOW, so you can get the information off of it as you need it. The process is very simple and consists of 3 easy steps:

STEP 1: Get 5 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 5 $1.00 bills and place ONE inside EACH of the 5 pieces of paper so the bill will not be seen through the envelope to prevent thievery. Next, place one paper in each of the 5 envelopes and seal them. You should now have 5 sealed envelopes, each with a piece of paper stating the above phrase and a $1.00 bill. What you are doing is creating a service by this. THIS IS PERFECTLY LEGAL!

Mail the 5 envelopes to the following addresses:

#1 Robert Russell
1721 Corning Lane
Midland, Mi 48642

#2M. Lichen
P.O. Box 451105
Ft. Lauderdale Fl. 33345-1105

#3 Amanda Sollecito
108 Haystack Rd.
Manchester, CT. 06040

#4 Ben Ku
1943 Grist Stone Ct.
Atlanta, GA 30307-1185

#5 Jason Leung
1102 Canyon Blvd.
North Vancouver
V7R 2K4 CANADA

STEP 2: Now take the #1 name off the list that you see above, move the other names up (5 becomes 4, 4 becomes 3, etc...) and add YOUR Name as number 5 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there is close to 18,000 groups) All you need is 200, but remember, the more you post, the more money you make!

Don't know HOW to post in the newsgroups? Well do exactly the following:

FOR NETSCAPE USERS,

1) Click on any newsgroup, like normal. Then click on
"To News, which is in the top left corner of the newsgroup
page. This will bring up a message box.

2) Fill in the SUBJECT with a flashy title, like the
one I used, something to catch the eye!!!

3) Now go to the message part of the box and retype
this letter exactly as it is here, with exception of your
few changes. (remember to add your name to number 5 and
move the rest up)

4) When your done typing in the WHOLE letter, click on
FILE above the send button. Then, SAVE AS.. DO NOT SEND
YOUR ARTICLE UNTIL YOU SAVE IT. (so you don't have to type
this 200 times :-)

5) Now that you have saved the letter, go ahead and
send your first copy! (click the SEND button in the top
left corner)

6) This is where you post all 200! OK, go to ANY
newsgroup article and click the TO NEWSbutton again. Type
in your flashy subject in the SUBJECT BOX, then go to the
message and place your cursor here. Now click on
ATTACHMENT" which is right below the SUBJECT BOX. Click
on attach file then find your letter wherever you saved it.
Click once on your file then click OPEN then click OK.
If you did this right , you should see your filename in the
ATTACHMENT BOX and it will be shaded.

NOW POST AWAY!!

IF YOUR USING INTERNET EXPLORER:
Its just as easy, holding down the left mouse button,
highlight this entire article, then press the CTRL key
and C key at the same time to copy this article. Then
print the article for your records to have the names of
those you will be sending $1.00 to.

NEXT
Go to the newsgroups and press POST AN ARTICLE type
in your flashy subject and click the large window below.
Press CTRL and V and the article will appear in the
message window. **BE SURE TO MAKE YOUR ADDRESS CHANGES TO
THE 5 NAMES.** Now re-highlight the article and re-copy itre-copy
it
so you have the changes.... then all you have to do for
each newsgroup is CTRL and V and press POST . Its
that easy!!

THATS IT! All you have to do is jump to different
newsgroupes and post away, after you get the hang of it ,
it will take about 30 seconds for each newsgroup!

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200

Thats it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of mail you receive. If you wish to stay anonymous, you con invent a name to use, as long as the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**

Now the WHY part:

Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #5 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #4 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM postswith my name at #3 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200with my name at #2 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #1 and they each only receive 5 replies, that just made me $3,125.00!!! With a original investment of only $5.00! AMAZING! And as I said 5 responses is actually VERY LOW! Average is probable 20 to 30! So lets put those figures at just 15 responses per person. Here is what you will make:

at #5 $15.00

at #4 $225.00

at #3 $3,375.00

at #2 $50,625.00

at #1 $759,375.00

When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $5.00 to names on the list, putting your name at number 5 again. And start posting again. The thing to remember is, do you realize that thousands of people all over the world are joining the internet and reading these articles everyday, JUST LIKE YOU are now!! So can you afford $5.00 and see if it really works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday

and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual internet. Remember, play FAIRLY and HONESTLY and this will work. You just have to be honest. Make sure you print this article out RIGHT NOW, also. Try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly. Remember, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea to make the money!!

GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH. **By the way, if you try to deceive people by posting the messages with your name in the list and not sending the money to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that and he only made about $150.00, and that's after seven or eight weeks! Then he sent the 5 $1.00 bills, people added him to their lists, and in 4-5 weeks he had over $10k. This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time!!! You also may want to buy mailing and e-mail lists for future dollars.

Please remember to declare your extra income. Thanks once again...

The Sound Of Noise

http://aasen.dyn.ml.org/index.html

Finally i know it was Grewling and Truely A long wait for you all.
Reason...I Re-Aranged the Site again...Got my own Domain name and Had Much
more Work to do than Usual.

Here's the Rundown on this show:
Mustard Plug - You(new Album!)
Aks Mamma - OJ(Check for there Interview)
The Go-Go Rays - Conspiracy
Opiate - Floating in Time
KraftWerk - Kohoutek Version 1
Anchent Faith - 7 gates
Doctors Of Dub - One Drop Clanger
They Might Be Giants - Birdhouse in your Soul
Lords of Acid - she and Mr. Jones
ME! yup that right - The Sound Of Noise
Icicle - The Orion Connection
basehead/klf - twitch

There's the Play list..I also did Lots of interviews and other fun stuff Enjoy
the New Site i will be changing it a little as time goes by to improve and
update it.

2384. Re: WeFAX, weather satellite

Austin-

No license is required to receive these broadcasts. Some data is
available on shortwave frequencies; other data you have to be able to
receive satellite signals for. There are several shareware programs
out there that can decode using your PC and a shortwave radio. I am
happy with a program called JVFAX - the current version is something
like 7.0. Search for it on your favorite search engine. This program
works okay with a plain shortwave radio (must have a BFO), and a
simple interface to your PC's com port (consists of a single op-amp
and a few resistors/capacitors). There are other programs out there
that will work using just your sound card (no interface required), but
I have not found the quality of the images to be quite as good.

Hope this helps.

From: Erik Skovgaard <Erik_Skovgaard@bc.sympatico.ca>
Message-ID: <01bc584d$ef5b5ec0$7fd866cf@default>
Source record: 30345

Has anyone on the list tried to use the Alinco DX-70 TH on Clover or Pactor-1 or 2 modes?

Since the filters are at least somewhat favourable towards digital mode, I am considering it, however, the spec does not state the delay from RX to full power on TX, nor does it state the recovery time from TX to RX.

73 de VE7MDL ....Erik.

Have you checked prices of such equipment at local PC and PC repair
stores? You might get your best deal through one of them.

In <336b469d.30324717@news.atl.bellsouth.net> ke4zv@bellsouth.net (Gary Coffman) writes:

>>I think it *does* provide a significant speed increase over 1200 baud.

>I guess that's a function of what you consider "significant". I tend to consider
>as significant changes of an order of magnitude or more, IE a 10x or better
>improvement. The jump from 1200 to 9600 is roughly on that order, and is
>worth expending considerable effort to achieve.

My experience with G3RUH modems is that a significant (in your terms) speed
improvement can only be achieved with specialized RF hardware. Existing
Japanese FM transceivers simply aren't going to work. But they are no
problem with HAPN 4800 baud.
When you are going to upgrade your HF hardware anyway, it may be better
to go for 56kbps.

>Use of the HAPN modem does require a bit more effort than "plug and play",
>and does require that you organize an effort by others to upgrade as well, and
>really requires you to coordinate another channel since 1200 and 4800 baud
>modems don't coexist well.

1200 and 4800 baud modems coexist very well. the only problem are the
1200 baud stations with "software dcd", "digital dcd" and whatever they
call it, but they coexist with nobody else.
usually those designs have some jumper or setting to disable it, you only
need to convince the users to do that.

>If you're going to do all that, you might as well
>expend a little more effort and go 9600 baud.

Many users don't consider "dump your brandnew '9600 ready' rig and buy
a TEKK or surplus crystal-controlled trx" as "a little more effort" :-(

There is a big problem with commercial mis-information in this world.
When a user asks "how do I get to 9600 baud" on the BBS, he will get
many replies telling him where to order a TEKK, an SCC card, and a 9600
baud G3RUH or DF9IC modem kit. Then, he will visit his local dealer who
will talk him into buying an AEA PK-96 (analog filters) and a Kenwood
"9k6 ready" trx (with modulation in the PLL, and very slow keyup). Of
course, he will be disappointed by the performance and we can tell him
he should have listened to his fellow hams instead of to the commercial
guys, but most of the time it is too late. Had he used HAPN 4800 baud,
he would not have been so disappointed with the station's performance,
and he would have spent a lot less money.

>I suppose that if you can *easily* get all your local users to switch from 1200 baud
>to 4800 baud, it would be worthwhile. As long as the manufacturers include a 1200

>baud modem in their TNCs, however, I don't think you can really abandon 1200 baud
>completely. So if you have to maintain a 1200 baud service, it doesn't make sense
>to uprate your second service to only 4800 baud when you can do better for a little
>more effort.

Most nodes here have started adding 4800 to 1200 on the access channel,
then (when financially possible and when the trx was suitable) added 9600
to that, and often have dropped the 1200 baud support at that time.

As most of our nodes are still maintained and payed for by very small groups
of people, we don't have to "maintain a 1200 baud service". There is no
user who pays us for a service, and in our license conditions it is stated
that the license is for doing experiments with radio technology. We don't
consider the forever maintenance of backward compatability a very convincing
experiment, and think that it blocks any possible progress.

(Indeed, large number of users is upgrading to higher speed only at the
time 1200 baud is finally dropped, even when that point in time is announced
a year beforehand. And then, they regret the fact they did not do it before)

An amateur radio operator in Spain has sent an e-mail (in Spanish) to the University of Texas Amateur Radio Club, requesting information about packet radio. He wants "to enter the world of packet radio," and is looking for something about it on the Web and in Spanish.

There is no evidence from his e-mail that he speaks any English.

If anyone has a pointer, please e-mail it to me and I will forward it to him. Thank you.

Miles Abernathy, N5KOB, miles@mail.utexas.edu, http://klingon.util.utexas.edu/

Or can you use any protocol you want as long as you:

1) describe completely the protocol format

2) identify the station sending

Anyone know for sure here? If it is legal to use another protocol, what are the requirements to make your protocol legal besides the guidelines I think logically should be a part of any new protocol that I listed above?

Thanks,

David L Pearce

THE 69TH ANNUAL ATLANTA RADIO CLUB'S HAMFESTIVAL

The Atlanta Radio Club's Hamfestival on June 21-22,1997 is
the Southeast's premier hamfest.This hamfest is brought to you
by the Atlanta radio club,with the help of many of the local
radio clubs here in the metro atlanta area.This is our club's
69th annual hamfest,and with your attendance we hope it will be
our biggest and best to date.
This years event on June 21-22,1997 will be held at the
Atlanta City Hall East-Exhibition Center,675 Ponce de Leon Ave.This is
the same great site as last year's hamfest,which is near the downtown
area,and very easy to get to,and plenty of free parking.
On the days of the hamfest,we will be usings our clubs repeater
(W4DOC 146.82 Mhz minus 600Khz offset) on top of the Nations Bank for
talk-in.This repeater is used every Sunday night 8:00 pm for the
Atlanta Radio Club's net.If you are in the area your presence on the
net is welcomed.
For much more information about our Club and Hamfest plese check
out our web page at http://www.saf.com/arc.The club's BBS at
770-850-0546 has a lot of info also, or send email to dickb@akorn.net
our regular address is ATLANTA HAMFESTIVAL
P.O. BOX 942150,Atlanta Ga. 31141-2150
No matter what your interest in the radio hobbies are,you will find
you came to the right place.Amateur Radio,Shortwave radio,Scanners,
Satellite radio,Emergency radio,Marine radio,Military surplus
radios,etc.AM,FM,SSB,CW,PACKET,RTTY,SLOWSCAN,FAX,DX,ATV,AMTOR,EME,whatever
your interest this is the place to be.If your into building or
homebrewig equipment,radio or computer this is the place to find those
hard to find parts and gizmos.
The computer hobbies are doing better than ever and these interest
will be well covered at the Hamfest.
Buying,Selling,Trading,Swapping,Dealing,Bartering,Giving will all
be happening at the hamfest,probably some begging also.Whether your
coming with money to buy,a load of goods to sell,or just looking
around this is going to be a great hamfest.

The Atlanta Radio club has our regular meetings the first Thursday
of each month.These meetings are at 7:30 PM,located at the Georgia
Power Fedral Credit Union, 4900 Ashford-Dunwoody Rd.this is near the
I-285 loop on the north side of the city.
The Atlanta Radio Club is a non-profit organization wishing to
promote Amateur radio to all interested.
Our club president is Bill Bass W4LFC ph# 770-493-8438,his email
address is BillW4LFC@juno.com ,our vice-president is John Talipsky,Jr
KA4VQH ph#770-925-7110 his email address is johnka4vqh@juno.com ,our

club Secretary is Penn McClatchey K4PE ph#404-605-0742 his email is pmm@saf.com our Treasurer is Charles Golsen N4TZM ph#404-252-3303 his email address is cgolsen@atlanta.com ,our clubs activities manager is myself Richard Dean Young KR4IU ph#404-622-8433 my email address is rychard@atl.mindspring.com ,the opinions expressed are my own and are probably bias due to my love of the radio hobbies.
Hope to see you at the hamfest soon.

Not true. See below.

>
> 1200 and 4800 baud modems coexist very well. the only problem are the

Here is an interesting fact. A HAPN modem configured as a bit regenerative repeater will regenerate both 4800 HAPN signals as well as 1200 bps AFSK signals. I have personally demonstrated that on a 4800 bit regenerator system installed at our node site at Rigaud QC. If you want the technical details as to why it works, I could explain it in another msg.

Add two nodes to the regenerator radio, one at 1200 and one at 4800 HAPN with the PTT and RF DCD lines cross connected (thru a diode matrix) and you will have a node system that can use both 1200 and 4800 on the same channel. It will have the advantages of a bit regenerator (avoids conventional HTS but not "Key-up HTS") plus 1200 users will be able to communicate with the 4800 users and vice versa by linking thru the two nodes.

Of course this kind of experimentation is for real amateurs, not plug'n'play addicts :-)

Great idea for using email via packet. I think that's a reasonable idea for 'extending' the internet onto packet radio.

>I just don't get it.

I don't get that either, Todd. I think the internet is a tool to be used in conjuction with ham radio. We already have AMPRnet wormholes on the internet so you can do just what you mentioned. I run a JNOS system here so I can connect my little DX cluster node in Guam to the big cluster in the U.S. via the internet. Why some people have a woodie for the telephone, I can't tell you. The internet connection has not hurt packet radio here, it's gotten a few more people interested in it.

The point I wanted to make in my orignal post was that I think we should be developing some ham radio applications to be used with the internet instead of trying to reinvent the GUI interface and make web pages available on the local packet frequencies.

I just looked at this web site. I always thought that there were about 1.5 dollars to 1 pound sterling, but it seems that I'm wrong - a pound sterling is worth only 50 cents - at least when you buy GPS outside the US.

$330 + $45 tax for an Eagle Explorer. The postage must be expensive!!

Since you didn't mention any particular country's regulations:
The norwegian regulations states (roughly translated)
"Digital communication must use publicly available protocols,
and the content should be readable by publicly available software.
It is not permitted to encrypt traffic ...."

2402. internet over ham radio?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-05 00:00:00 UTC
From: gholcomb@zipnet.net
Message-ID: <gholcomb-0505970006000001@lowell-ip182.ziplink.net>
Source record: 30264

Hi,
I'm a very newbie hm radio operator. (just thought I'd get that out of
the way) I was wondering what the feasability of making an ethernet bridge
using ham radio. The main goal is to use tcp/ip if there is a better way
to do it without using ethernet. If anyone has any information regarding
this, I'd very much apreitate it.

thanks,
-Gus Holcomb

>networks (like the packet networks today) to effectively bypass distance
>limits in the network area.

Note that it isn't specifically 20 Mbps; it's 20 MHz minimum spectrum width, and must be "high speed" (defined by the FCC the way Justice Stewart defined pornography: They'll know it when they see it, at type approval time). I suspect that, say, T1-speed links using spread spectrum would be fine.

The ERP limit at 5.8 has been removed for point-to-point links, not sectorized or point-to-multipoint links. It never applied to receive gain, though, so you could build an interesting multipoint access system using, say, a 6 dBW ERP sectorized base transmitter and a lower-power CDMA remote using a 6 dB gain transmit antenna inside or next to a high-gain receive antenna. The regulations specifically allow this.

Actually, by ham standards, the "narrowband" allocation at 2400 MHz is pretty fast, though it's closer than I'd like to domestic microwave ovens.

Hi Patrick,

I hate to be negative... but the blue book value on that
computer is well under $100.
This may sound odd, but the only usefull item on the list
is the modem.
Lots of businesses just throw the 386's they replace out.
You aren't trying to take advantage of anyone are you?

Trevor

Quite rightly you point out the difference in prices between the US and the rest of the world. However there are reasons for this. In the case of Eagle we are talking about a product manufactured in the US, alone.

If you buy directly from a US supplier you will be liable to pay import duties on your purchase when delivered in the UK (or elsewhere). In addition you will have to pay 17.5% VAT on the combined purchase price and import duties. So at the very least there will be an additional charge of between $12-30 dollars per hundred. In addition, the only trusted method of overseas delivery from the US is via courier which will add at least $20-40 to the purchase price (in our experience, and in some cases as high as
£60).

It is also worth bearing in mind that there will be additional costs should the product prove faulty or need servicing, ie the cost of delivering the product back to the US supplier. We're talking pretty advanced electronic gear here and you may want to have a local supplier. In addition the UK has pretty strong consumer laws protecting you for at least one year (and there is talk of extending it to two). These laws mean 'we' the supplier are liable - we can't just fob you off on the manufacturer. In the US I am not so sure this is the case - and in any case, do you really want to try argue the point over such a large distance?

As an authorised supplier of Eagle we are constrained by the price at which we can obtain officially (and legally) imported and supported product from Eagle in the UK. In turn the distributor is constrained by all the above costs of shipping, insurance, import duties etc etc.

On simple mathematics it always looks to the consumer that it is cheaper to import directly from a US supplier but at the end of the day you pay for what you get.

Regards

Smokey

Check out HamWeb at http://www.tapr.org/~wa0ptv

It is a broadcast protocol fileserver specifically designed to push web
pages
out over local packet radio.

I wondered about this same thing. I know that the rules used to
specify AX.25, but my reading of them is that they don't any longer
(I'm talking about the U.S. here).

I found a hypertext version of the FCC rules on the W5YI website.
The relevant page is:

http://www.w5yi.org/w5yi/part97d.htm#97.309

It says (in part):

b) Where authorized by 97.305(c) and 97.307(f) of this Part, a station
may transmit a RTTY
or data emission using an unspecified digital code, except to a station
in a country with
which the United States does not have an agreement permitting the code
to be used. RTTY and
data emissions using unspecified digital codes must not be transmitted
for the purpose of
obscuring the meaning of any communication.

That would seem to clearly permit other than AX.25 to me. This came up
for me in the
context of developing the HamWeb Broadcast Server (see
http://www.tapr.org/~wa0ptv). I
wanted to use packet lengths of 1024 bytes (longer than specified in
AX.25) and I conclude
from the above that it is legal.

>Depends on where you are. The UK licence puts no restrictions on
>protocol. There is no requirement to describe the protocol format,
>although you have to make sure you don't fall foul of the encryption
>regs. An ident is required though.

That, of course, is the crucial point. Most people would like to avoid
the costly ident, and in many countries (including the Netherlands, where
I live) it is allowed to omit the ident when using a protocol like AX.25.
So, one can use other protocols but one would be forced to ident in one
of the allowed forms (voice, morse code) using a defined modulation mode.

Apparently, AX.25 does not have that special status in the UK, and the ident
is required anyway.
Our previous licence *required* the use of AX.25 or else a special permit
would have to be applied for. This was changed a few months ago, but the
requirement to ident was then more clearly specified.

E-Mail Your Way To Riches!

Dear Friend,

We all know E-mail is here to stay. It's fun, easy and exciting! Would you be interested if we could show you a way to make well over $1,000 per week doing it?

This is not a joke. You may have seen many people trying to tell you that you can make money by joining this or that scheme! Guess what, you decide to go for it and then you get nothing but frustration and disappointment! We are here to take your frustration and disappointment into an Electrifying Adventure!

We have been marketing on-line for almost 2 years now! We have never spent one red penny on advertising and made nothing but profits. We can show you how to make money every day of the year. Many people may think this is untrue or it just can't be done. We are here to tell you that it is absolutely not true. The biggest mistake people make about marketing on-line is that they sit and wait for people to contact them. You will never make it if this is your approach and we'll tell you why. There are over 60 MILLION people on-line right now, and seven new people logging on every minute of the day world-wide and everyone is offering something. So how do you get a potential client or a new customer before your competition does? The answer is simply " Creative E-mailing" and it WORKS! I'll tell you why. You're taking your product, service or idea directly to the market instead of waiting for the market to come to you!

Here are a few testimonials we'd like to share with you (They're all 100% TRUE!):

Internet Communications, my wife and I owe you so much. We ordered your Creative E-mail System and within the first week we received over $1,150 in orders for my Internet Consulting business!
--Charles -- California

I have bought two so-called E-mail programs that cost me over $600.00 when I received them. They were extremely difficult to operate and it took me about two weeks to figure them out. Once I did, they were so time consuming it just wasn't worth my time. When I received your course it took me about four minutes to install and I was in business! Within the first 24 hours of my first E-mailing I received over $580.00 in sales over the phone. That first week I grossed over $2,000.00! I really can't believe how easy you made this, anyone can do it! Thanks!
--Dennis -- Illinios

Hello, I'm a divorced mother of two children. I wanted to thank you for helping me out. This was my first time buying anything on the Internet. I was skeptical at first but I figured I'd take a chance. This was the best chance I've ever took! My part-time business is now a full-time home-business, thanks to your

Creative E-mail System. I had to hire my two family members to help me out!
This is GREAT, thanks so much! I'd recommend this for anyone!
--Ellen -- Florida

You may have seen other people offering products "E-mail Programs, E-mail Addresses, Extractors, Etc." The vast majority of these products are very over-priced and very difficult to even use. None of them even supply you with current, up-to-date, FRESH & RESPONSIVE E-mail addresses! Our Creative E-mail System puts everything into one package to make your profits soar immediately! Even if you do not have a product or service to offer, we are going to give you over 500 how-to reports that you will have full reprint rights to! What makes our course different from anything else being offered anywhere is that we're dedicated to your success! We do not succeed unless you succeed! All of our E-mail Address Databases are created in house. We do not trade our databases with anyone because people are selling extremely bad lists on the Internet. Many of other people's databases are filled with duplicate addresses and many of them are undeliverable. We keep our own database so we know exactly what we have and we keep nothing but the best. There's no other way. We believe in producing high quality products that should be priced reasonably for your success! Read on to see the special bonuses you will receive.

******** SPECIAL 10 DAY BONUS ********

If you order within the next 10 days we will include:

1) 500 How-To Reports (You may resell these at any price)

2) Your Personal Complete Guide To The Internet -- This 175 page e-book covers every single aspect of the internet. You will never have to buy another internet book! When you complete this book, you will know more about the internet than 90% of the people online right now.

3) When you purchase our 8 MILLION SUPER responsive E-mail list we will include Mega-Mailer. It sends 250,000 E-mails per hour! All other orders will receive Pegasus Mail. It mails about 30,000 per hour.

Here's how to get the Creative E-Mail System:

All orders are delivered on CD-ROM or 100mb Zip Disk (Iomega).

============> E-Mail Databases <================

2 Million FRESH E-mail Addresses only $ 99.95
4 Million FRESH E-mail Addresses only $179.95
6 Million FRESH E-mail Addresses only $249.95
8 Million FRESH E-mail Addresses only $299.95

You will be sending your Marketing Letter to 2, 4, 6 or 8 MILLION People! To mail to 2 MILLION People by U.S. Mail at $.32 per stamp would cost $640,000.00, not including envelopes or paper! The price of 2 MILLION E-mail Addresses isn't even a fraction of the cost. And the great thing is that if you have 10 products, you can E-mail to your list as many times as you want to! Your profits will never stop soaring! Don't pay someone else to send your

advertisement out, do it yourself and save big money! The average cost right now to send your ad one time to ONE MILLION people is $1,400.00. You can send it 100 times to EIGHT MILLION people for only $299.95 and that includes Mega-Mailer that sends 250,000 per hour!

==========> Order Form <==========

If you're looking for a Windows 95/WindowsNT program to control your Yaesu FT-990 radio, I've decided to offer my MasterControl 990 as shareware. The features are noted on my MasterControl 990 home page at http://prairie.lakes.com/~medcalf/

You'll need an RS-232 to TTL adapter to talk to the FT-990, and one available COM port on your computer (the program supports COM 1 through COM 9). The shareware registration is only $25.00 and I'll be happy to consider all suggestions for improvements from registered users.

The SAD part is that hams not only DO NOT carry the ball in that part
of the reasons for the AMATEUR RADIO SERVICE (not hobby) to

even exist, that is to carry forward an ever-advancing state of the art, (Which does not mean supporting Japanese electronics firms).

SADDER STILL is the fact that if someone DOES try to start a discussion of radio qua radio, he/she is likely to be derided, and/or buried in trivia.

I've seen it several times.

The problem is that the 1200 baud modem won't give a reliable DCD when
a 4800 baud station is transmitting. Thus you get lots of collisions between
the 1200 baud and 4800 baud users. That's why you don't want to mix them
on the same channel.

John, this rules section is talking about *codes*, not protocols. What they mean by unspecified codes is codes other than ASCII or Baudot used to represent message content. The only place where protocol becomes important is in the autoforwarding section of the rules where AX25 is specifically required as the protocol to use for *unattended* message relay. As long as you're present, you can use any protocol you like to package the data, but the data must be encoded with a specified code except as noted above.

Clearly, AX.25 is >>not<< the law.

Otherwise, we would not have AMTOR, PACTOR, CLOVER, etc. These are not constrained to HF, tho for technical reasons, some are better suited for HF. A few really would do better on VHF than AX.25 packet, but seems never to have gotten anywhere.

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

I spoke with Kenwood's Technical Representative today and he related that within a week or so - perhaps in time for the Dayton Hamfest, Kenwood will have a Windows 95 program that will allow file uploads and downloads from the TM-V7A. It will enable alpha numerics for and load the memories with frequency and PL tones. No other remote programmability is planned. The program is supposed to sell for $39.95 and use the data port & PG5A connector.

This will certainly take the pain out of loading memories - especially after a CPU reset!

I am desparetly looking for the schematic to this radio, Tempo VHF/One
2m radio, or help connecting it to a KPC-3.

It has a round connection labeled ACC with 9 female pins to connect
to. I was able to figure out receive audio and ground easily but not
the others, PTT, Transmit audio, etc...

Any help is appreciated!
Please relpy to my email address.

I had email to/from the company that is actually doing the work on this project. I put a bug in their ear that since they had the interface to communicate with the V7, gee, wouldn't it be a great way to make a cheap remote base? A single card computer talking to the V7 and all you would have to do is plug in a control receiver... simple and cute.

Major hint. The control head is just that, a control head. Four wires (ground, power, data in and data out) are all that will be used. Someone want to figure out how to interface it? Or make new software other than the cloning software?

Rick

Here in Australia we are allowed to use any link-layer protocol that we like, provided that the transmitting station identifies itself using an "internationally-recognised code" at specified maximum intervals. This internationally recognised code can be anything from morse code or voice to ASCII/AX.25 or even TCP/IP (since IP addresses are traceable back to their source via the master DNS registry).

As far as I know, I wrote the only Atari ST sofware back in the 80s. I wrote a split screen terminal program for the ST called Pack-Et-Term, and also ported the W0RLI MAILBOX (thru version 2.5) to the ST. The mailbox version also had the terminal program built in, so it was handly to use the RLI stuff as a personal mailbox if desired. The whole mailbox was small enough to run off a floopy disk. (Those days are gond forever!) I would have to look for the disks and could perhaps EMAIL you the files if you are interested. (The ATARI stuff is not at my WEB site, and FYI it was all FREEWARE).

Fellow Hams:

Our company is developing a new packet terminal application which will be released later this year. In determining which would be the most compelling features, we are curious the percentage of packet time spent in the following activities:
1) Bulletin Board Sytems(BBSs)
2) DX PacketCluster
3) General QSOs (HF)
4) General QSOs (VHF)
5) Other (describe)

We appreciate the time you're taking to read this and reply! Please reply to dtburr@mcs.com.

Sincerely,
Dave

Hi
I made a similar comment on the local repeater here in phoenix.
the topic was no-code vs. know-code.
except adding to the "number" what have they done to promote
ham radio. even the novice 20 years ago did his part.
built kits , learned electronics,and code.
now the newbies want it all for free.

This has been discussed for the TM733 as well, but nobody has done
it... It seems like all restrictions as to out-of-band operation,
xband repeater, 1750Hz tone etc. Is only present in the "control head"

Is that explicitly allowed in Australia?
Over here, you have to ident using the callsign the authorities have
given you, not using some alias that might be mapped back to the callsign
using some table that is completely outside of their control...
(when that is allowed, why not ident using your phonenumber or car license
plate?)

hi guys...

First: thank you for your replies about this subject...

Second: this is a long message. please don't reply with the whole message included! have some respected to the other guys that use this newsgroup!

The first contact with this project was 2 years ago when I bought the book "Packet: Speed, More Speed and Applications"
If you prefer, SKIP to THERE->

Last month with some extra bucks (escudos actually :) in my pocket i tought: wouldn't be great a > T1 packet network covering entiry portugal and even connect it do other contries? My packet experience is very limited. Contructed the famous 1k2 baycom modem (with the TCM3105 chip) and made several experiments with Linux and a pair of VHF/FM radios... The problem was speed... and traffic... too many stations on a channel isn't very good...and gamming doom with a friend or mudding would be impossible:)

SKIP TO HERE!
So...i'm thinking on spending those extra bucks with the TCP/IP 2Mb/s 2 way uwave link experiment but with the posts that i could catch (my USENET server has a very low expire time and for the last 2 weeks the university modems - used by me for instante to get e-mail & usenet at home - were broke so I lost some of the posts...those that i could catch, reading directly at the University, I forwarded them to me) some cool e-mail, reading the project and checking some web pages
HERE ARE the questions:

- why Glenn and Kevin don't use a scrambler/descrambler to improve the demodulation?is that necessary?

- doesn't the frequency shift produced by the modulation afect the receiver, since the frequency of the gunn is used as a L.O ?

- to a first experiment could I use RS-232 interfaces connected to the circuit (with the correct voltages of course) instead of using ethernet cards, since i doubt that i could get less than 10Mbit/s working cards.Oh...and yes, I have and can get cheap 10Mbit full-duplex cards (I have 3 at home with 10baseT and 10base2 interfaces)

- what is the maximum distance REPORTED with a low and perfectly usable BER ?

- does the LM317 regulator is capable of running with more than 2Mb/s rate? The gunn sources at shfmicro use a varactor to modulate: what

changes would I need to do? Aply a bias voltage to the gunn and aply the LM317 voltage to the varactor or wy don't use a simple ampop to modulate the varactor?

- were and who or which people or country are using these schematics for a reliable packet network? e-mails or web pages would be great.

- why the packet net reported at N6GN is using 230Kb/s and not 2Mb/s ?

I'm a poor student with not much money to spend on this project and since i enjoy communications a working link would be very cool and would make me and my friends proud of beeing one of the first (i think) portuguese amateurs going faster than 230K/s and using TCP/IP/uwave to do it.So if you (Glenn and KEvin) think that this project needs improvments (especially if you think it needs more strange:] stuff to work with RS-232 - not including some MAX232:] interfaces for a first experiment) please tell me, since if i spend a lot of bucks and it doesn't work as expected i wouldn't be very happy...
I studied and read the project but the questions above remain and think are important...

ANOTHER question: If i would use some other kind of modulation (like a 2bit/symbol 4bit/symbol etc) do you have any advise to the emitter or receiver?

2438. TECHNICAL CONFERENCE ANNOUNCEMENT

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-08 00:00:00 UTC
From: jward@fletch.fix.net
Message-ID: <5ktcv6$2ef$1@zinger.callamer.com>
Source record: 30160
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew,rec.radio.amateur.misc

The Audio Engineering Society will hold its 14th International Conference entitled "internetaudio.aes.org" in Seattle, June 13 - 15, 1997. This conference will examine the technology shift toward computer-based, networked environments and its impact on the audio and
multimedia industries. This technical conference will feature presentations and demonstrations,
discussion and interaction to chart the future of the internet audio industry.

The 14th International Conference is chaired by three internet audio authorities: David Johnson
(New Media Designs, Inc.), Aurika Hays (Progressive Networks) and Ken Pohlmann (University of
Miami). The full three-day program will include ten technical Symposia and nine Discovery sessions, featuring more than 50 invited presenters, each an industry expert. Scheduled topics
include: open platform audio standards, audio policy and delivery, music and radio distribution
over packet networks, server push technology, point-to-point audio, workstations and editing
systems, online content development, perceptual coding for computer environments, binaural and
multichannel listening environments, virtual 3D audio, simultaneous multi-location recording,
internet copyright and the economics of internet commerce.

Nonmembers: $475
Full AES members: $395
Student AES members: $295

The conference venue is the Bell Harbor International Conference Center, 101 Stewart Street,
Seattle, WA 98101. This newly-opened waterfront facility offers a prime location near downtown
Seattle.

Please consult "http://internetaudio.aes.org" for complete conference information, and to complete
your online registration.

Audio Engineering Society, 60 E 42nd St Room 2520, New York, NY, 10165-2520, Phone: 212-661-8528

2442. Help with HamCom software...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-08 00:00:00 UTC
From: gekko95@ix.netcom.com
Message-ID: <5krtom$p5r@sjx-ixn6.ix.netcom.com>
Source record: 30299

Hello all,

I have just built an RS-232 adapter to use with HamCom, and it seems to be working really well so far. I am able to easily copy CW, and the copy is great (I'm a ham with 30wpm proficiency, so CW is not my interest here).

What I'd like to copy is commercial RTTY, like you find around 4990 or so and up in the 8200 range. Seems like tons of it there, but how do you tell what shift to use? 170? 850? USB or LSB? How do I know if I'm even listening to RTTY and not some other digital variation I haven't heard of yet? The only RTTY I know is the old 170hz shift ham stuff from my teen years in the 70's, hanging out at an old timer's shack with a Model 15 teleprinter.

As you can see, I am rather a 'digital novice' and could use some help. Maybe if someone has a freq of a very strong commercial station (I'm in the Pacific Northwest of the US) with the parameters needed to decode it, I'll then get a better feel for what the tuning, scope, and other tools actually do with 'real' signals that will decode. Some of the stations just below 5000 just BLAST in here, with 40 to 60 over S9, so I am sure I can get a good 'read' if only the paramters are right. There are soooo many parameters to fiddle with that after 3 hours of experimentation, I am no further along.

Also, how do I tell, from the sound, what the different signals are? I have used a Fax adapter to receive weather maps, and know that sound. But there seem to be about 3 or 4 other modes (besides FAX and RTTY) that I do not recognize.

Lastly, is there software that uses the HamCom style adapter to decode weather fax? I have a commercial adapter for that, but it is different and won't work with HamCom. I'd like to have just one adapter (the one I built) so I don't have to switch back and forth for each mode.

Boy - some guys think copying CW in your head is hard! Compared to that, this has been a real brain tease :)

Thanks to any who reply.

2444. Baycom modem with Linux ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-08 00:00:00 UTC
From: Luis Tato <deec253@tom.fe.up.pt>

Source record: 30301

Hi!

Thanks for reading this message.

I'm trying to set-up a Linux system to work with the ser12 Baycom
modem. It is working, but its performance is quite poor when compared with
the JNOS/DOS system, because there are much more lost packets, especially
if they are too long.
I think it is due to the Linux's multitasking capability, but I
may be missing something.
Is there any way to improve this modem's performance with Linux?
Some parameter tuning?

I'd be grateful if you could give me some advise.

The Linux kernel is 2.0.27.

Thanks in advance.

73.

I have gotten a company interested in adding packet email support to their fully featured win95 email program. It would integrate packet into the same program that polls for internet email, filtes, forwards, page notifies, alpha pager forwards, etc.

They don't have any hams on staff. I don't have enough packet knowledge or experience in current bbs or pbbs operation to know the best way to know how to tell them how to make this work.

If some one here would like to lend some assistance, please respond to me in email.

I don't want to announce the company, and have them get deluged with email about this yet.

I don't stand to benefit from this financially. I just want an all in one program.

Chris Arndt KD6DSI

---

bit bucket /n./

1. The universal data sink (originally, the mythical receptacle
used to catch bits when they fall off the end of a register
during a shift instruction). Discarded, lost, or destroyed data
is said to have `gone to the bit bucket'. On Unix, often used
for /dev/null. Sometimes amplified as `the Great Bit Bucket in
the Sky'.

2. The place where all lost mail and news messages eventually go.
The selection is performed according to Finagle's Law;
important mail is much more likely to end up in the bit bucket
than junk mail, which has an almost 100% probability of getting
delivered. Routing to the bit bucket is automatically performed
by mail-transfer agents, news systems, and the lower layers of
the network.

3. The ideal location for all unwanted mail responses: "Flames
about this article to the bit bucket." Such a request is
guaranteed to overflow one's mailbox with flames.

4. Excuse for all mail that has not been sent. "I mailed you those figures last week; they must have landed in the bit bucket." Compare black hole.

This term is used purely in jest. It is based on the fanciful notion that bits are objects that are not destroyed but only misplaced. This appears to have been a mutation of an earlier term `bit box', about which the same legend was current; old-time hackers also report that trainees used to be told that when the CPU stored bits into memory it was actually pulling them `out of the bit box'. See also chad box.

Another variant of this legend has it that, as a consequence of the `parity preservation law', the number of 1 bits that go to the bit bucket must equal the number of 0 bits. Any imbalance results in bits filling up the bit bucket. A qualified computer technician can empty a full bit bucket as part of scheduled maintenance.

There is a KA9Q port with many extra features, which I developed. There
is an Atari ST version and it can be found on my homepage (see signature).
There are some extra docs that are not on the homepage but can be found
on my BBS which is described on the page.

I have used the program for about 8 years on an ST at home, which I
retired in favour of a Linux system. One of the major nodes in the
Dutch packet radio network still uses a Mega ST2 with my software.

2450. Re: 2 Mbit/s N6GN uwave link - again

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-08 00:00:00 UTC
From: ge@sr.hp.com
Message-ID: <5kt36r$at1@canyon.sr.hp.com>
Source record: 30307

Nuno,
I'll touch on some of your questions but please see the web pages

http://www.tapr.org/~n6gn/uwavelink/uwv.html

for more detail. They are only intended as supplemental information but
I think they address many of your questions.

Nuno Sucena Almeida (slug@bbs.aeminium.pt) wrote:

: - why Glenn and Kevin don't use a scrambler/descrambler to improve the
: demodulation?is that necessary?

The article/project was primarily intended to demonstrate the value of
microwaves and directional antennas for high rate information transfer
via radio. It was more of a "teaser" than a proposal for how a data
link should be constructed for volume use. I hope that my comments at
the end of the original article reflected this adequately.

: - doesn't the frequency shift produced by the modulation afect the
: receiver, since the frequency of the gunn is used as a L.O ?

Yes, see the web pages for comments about adapting for full duplex use.
We originally solved this with a higher layer protocol rather than the
hardware.

: - to a first experiment could I use RS-232 interfaces connected to the
: circuit (with the correct voltages of course) instead of using ethernet
: cards, since i doubt that i could get less than 10Mbit/s working
: cards.Oh...and yes, I have and can get cheap 10Mbit full-duplex cards (I
: have 3 at home with 10baseT and 10base2 interfaces)

See the web pages for experiences (successful) at running Ethernet cards
at 2 MBps. I believe that users in Belgium have run the link with RS232
style interfaces as well.

: - what is the maximum distance REPORTED with a low and perfectly
: usable BER ?

We had about 10 dB excess C/N at a distance of 13 miles using the link as
shown in the article with 22" diameter dishes. This was almost exactly
what theory predicted.

: - does the LM317 regulator is capable of running with more than 2Mb/s
: rate? The gunn sources at shfmicro use a varactor to modulate: what
: changes would I need to do? Aply a bias voltage to the gunn and aply the
: LM317 voltage to the varactor or wy don't use a simple ampop to modulate
: the varactor?

see the pages, they refer to some alternatives.

: - why the packet net reported at N6GN is using 230Kb/s and not 2Mb/s ?

The 230 kbps network hardware is running using 900 MHz radios, not the
10 GHz ones. The Ottawa PI cards which interface them to the computers
will operate at a maximum of 230 Kbps using internal clock reecovery.
Even going this fast requires some modifications. See the pages.

: I'm a poor student with not much money to spend on this project and since
: i enjoy communications a working link would be very cool and would make
: me and my friends proud of beeing one of the first (i think)
: portuguese amateurs going faster than 230K/s and using TCP/IP/uwave to do
: it.So if you (Glenn and KEvin) think that this project needs improvments
: (especially if you think it needs more strange:] stuff to work with
: RS-232 - not including some MAX232:] interfaces for a first experiment)
: please tell me, since if i spend a lot of bucks and it doesn't work as
: expected i wouldn't be very happy...
: I studied and read the project but the questions above remain and think
: are important...

I would not recommend this as a base design for a network to cover a
large area. It was primarily intended as a demonstration, although a
usable one, of the economy of using microwave. For less money than most
users spend on 1200 bps, 2 MBps is possible.
If you are considering a permanent, wide area network, I would suggest
quite a number of changes. See the pages for a few more thoughts on
this.

: ANOTHER question: If i would use some other kind of modulation (like a
: 2bit/symbol 4bit/symbol etc) do you have any advise to the emitter or
: receiver?

This is a complex question. It depends upon what your goals are. FSK
is cheap and simple, however it also requires considerably higher C/N
than other techniques. This is an issue for basic system budget reasons
but perhaps even more importantly systems which operate at lower Eb/N0
can provide additional resistance to errors caused by multipath
distortion.

The tradeoffs among hardware cost and complexity, quality path/site
availability, information rate, spectrum availability, congestion,
channel coding, error correction and other issues are far from simple.

Please see the pages listed above under the "Old Hardware" section of
the Higher Speed Packet Page,

```
|--------------- N6GN's Higher Speed Packet WWW Page -------------------|
| |
| http://www.tapr.org/~n6gn/index.html |
| |
|-----------------------------------------------------------------------|
```

Also please see the description of our current efforts with L3TNC and
on-channel active repeaters on these same pages.

>tell what shift to use? 170? 850? USB or LSB?

Use the Spectrum function of the program to get a graphical picture of
the frequency peaks. You should be able to tell the shift from that.
Most commercial stations seem to be 850Hz shift these days, and nearly
all the ham transmissions are 170Hz shift. After setting the correct
shift based on what you see, adjust your radio's BFO and/or Hamcom so
that the two peaks are in line with the mark and space lines on the
display. Then switch to the text display and try each baud rate,
being sure to also try the Reverse option for each. You can go
through all the possibilities in a minute or two once you are tuned
correctly. Most ham RTTY is 45 baud, and commercial is often 75 baud.

>How do I know if I'm even
>listening to RTTY and not some other digital variation I haven't heard of yet?
>The only RTTY I know is the old 170hz shift ham stuff from my teen years in
>the 70's, hanging out at an old timer's shack with a Model 15 teleprinter.
>
Most of the commercial RTTY is encrypted at this point. That might be
why you are having difficulty copying. Most of what you find is
that sounds like RTTY is indeed RTTY, albeit maybe encrypted. The
exception is on the marine bands, where SITOR is used (this can be
decoded as Amtor-FEC, 170Hz shift, 100 baud with HamCom). In order to
initially get your setup working, try copying from the ham bands
instead.

Another thing to try is using HamCom's Send function and having it
just play the tones through your computer's speaker. Then you can
hear what the various different modes and baud rates sound like.

>As you can see, I am rather a 'digital novice' and could use some help.
>Maybe if someone has a freq of a very strong commercial station (I'm in

Here in the Midwest, a military station which gives continuous weather
reports during the day comes in very strongly at 12835 KHz. I would

think they would probably be readable there as well. These
transmissions are 75 baud, 850Hz shift.

>Lastly, is there software that uses the HamCom style adapter to decode
>weather fax? I have a commercial adapter for that, but it is different
>and won't work with HamCom. I'd like to have just one adapter (the one

Yes! It's called JVFAX, and it works very well. Current version is
7.0 I believe - search for it at on your favorite Web or BBS site.

>Thanks to any who reply.

: I think it is due to the Linux's multitasking capability, but I
: may be missing something.
Hi... I had similar problems... it depends the computer you are
using... for my experiments I used (i still use) a 386DX40 and when the
computer is doing something else (like accessing the harddrive) the
modulation/demodulation don't work correctly...the tones simply don't
get out right!

: Is there any way to improve this modem's performance with Linux?
: Some parameter tuning?
Try irqtune... its an utility than enables you to change the priority of
IRQ's...i never tried it with a baycom modem (maybe i will) or checked
if it really works with other kind of modem (like a telephone one) but
maybe it will!

: The Linux kernel is 2.0.27.
Same as me:)

> Don't depend on M$, use Linux for your HAM software AMATEURS FOR AMATEURS !

Can you give a pointer to a good distribution of Linux for hams?
Which distribution and where is it available.
I would really like something that is available on CD rom, has all the
ham and electronic goodies and doesn't require me to become a total
UNIX guru to get working.

Am I asking for too much?

michael N6CHV

2457. Packet GPS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-09 00:00:00 UTC
From: Michael G <michaelg@hula.net>
Message-ID: <33735076.632D@hula.net>
Source record: 30167

Does anyone out there know of any software around that will allow me to join gps, packet, and Delorme's Street Atlas all together? I would like to be able to have my home base track my movements on the computer using Street Atlas as I mobile around transmitting my gps position on packet. I know APRS is available, but don't want to have to go through the trouble of building maps and such when this is already available with Delorme.

I think what is needed is simply an interface program which will intercept the received packet information and slightly rearrange it to make it readable to the Delorme program. With that done, one CD will provide all the street information for the entire country.

Thanks.

Mike

Following my list of Kenwood commands for R-5000, also used by TS440
beside additional command strings regarding the transmitter part.
I found also no documentation about it. I tried it with the Windows
Terminal connected to my R-5000. Most important: all strings end with
";" not with <CR>. I am using it in my own control SW written in
QBasic. I hope you can interpret following table.

I have used the baycom multimode for packet and ACARS monitoring without any problems. Its small size makes it great for portable packet. I have used it on a pentium 166 with windows running without any problems, but the manufacturer recommends against this. Apparently the baycom needs the full attention of the cpu. All in all, it is a great modem and certainly the most bang for the buck!

Then Linux tain't for you. I do think Linux is the way to go, put it is
up to you to dig it out. You don't have to be a guru to learn it (it
helps tho', heh heh) but it definately isn't spoon fed to you.

Michael Ruther <Ruther@alliedsignal.com> wrote in article
<3370D1C5.1AB2@alliedsignal.com>...
>
> Hi
> I made a similar comment on the local repeater here in phoenix.
> the topic was no-code vs. know-code.
> except adding to the "number" what have they done to promote
> ham radio. even the novice 20 years ago did his part.
> built kits , learned electronics,and code.
> now the newbies want it all for free.
> aa7qa
>

The "newbies" and "would-be newbies" are NOT "wanting
it all for free" ... many are technical professionals that this
service desparately needs and all they want is the ability
to participate and contribute without having to waste large
amounts of their valuable time on developing "skill" in an
obsolete technique dating to 1847 when they're employed
at the leading edge of technology and want to experiment,
develop, and build systems using new technologies.

Ham radio would be FAR better off for welcoming these people
with open arms than by trying to keep them out with ridiculous
hazing rituals. The main problem is that most of the incumbents
are so technically inferior to the types of folks I'm talking about
that they can't begin to understand the benefits that they could
bring. And lack of understanding breeds fear, resentment, and
discrimination ... ham radio is in it's "dark ages" ... we need
major changes in licensing requirements/structure, technical
regulations, and ATTITUDES to create a rennisance ...

Hi,

Has anyone been able to get the Newton MP2K to work as a terminal
with the KPC3? I am using the PT100 software, but keep
getting buffer overflow errors and get no communication from the
KPC3.

Thanks...Win

2474. Packet VIA a KPC3+ And Yaesu FT50R,FT8000R or TM-V7A

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-10 00:00:00 UTC
From: niel brieger <nbrieger@ix.netcom.com>
Message-ID: <33752F7B.580F@ix.netcom.com>
Source record: 30184

I am wondering if anyone has gotten the FT50R to work properly with the Kantronics KPC3Plus. I thought I had it working somewhat a few weeks ago, but now all seems lost. The receive light on the Yaesu comes on, and the receive light on the KPC then turns on, but even if I have MONITOR on, I see no traffic going across. The next weird problem is with transmit. If the KPC transmits, the KPC transmit light comes on for a moment, then the Yaesu transmit light comes on, but when the KPC transmit light goes off, the Yaesu stays on transmit. I have to physically turn off the FT50R to get it to stop transmitting. Has anyone run into this?

Also, does anyone have any recommendations about using an FT-8000R by Yaesu or a Kenwood TM-V7A for packet? If you've set something like that up, I'd really like to know what type of results you got.

Thanks!

Niel Brieger, KC5ZJR

Thomas Sailer (sailer@ife.ee.ethz.ch):

: hdparm -u 1 /dev/hda
: hdparm -u 1 /dev/hdb
: etc.
: if you have IDE devices

A friend of mine had data corruption with that parameter. But it was a
rather old computer: a 386sx20 and a 250Mb drive. Now he has a MMX Pentium
but i don't know if he is using that parameter.

>UNIX guru to get working.

>Am I asking for too much?

Have you ever played with Unix or Linux ?

I'm rather new to HAM and packet radio and I have just bought my first set.
For 3 years I have run Linux now and it seems to me the ultimate OS for
packet radio (you have to discover this yourself, NO FLAMES).
I think Linux users/developers and radio amateurs both want to have the
POSSIBILITY to control and to know every little detail.

Unfortunaty using Linux is not common practice in packet radio land. Why ?
I don't know, maybee someone else can explain it to me.

But if you don't bother what's going on, run M$ products and call your
reseller if it's not working. However, I don't think you are a real radio
amateur in that case (perhaps my interpretation of radio amateur is wrong :)).

73,

Gerhard.

Check out the new website on the net! N9SBV's Ham Radio Connection at Http://members.tripod.com/~n9sbv/Status.htm

This new system is oriented toward helping the new ham radio operator with resources he or she may need to get the most out of their hobby.

Lots of shareware available for download from the FTP Site. With 2 of the NEC 7 disk Changers online for starters, there is over 15 Gig online of all types of shareware software.

The WebServer is focused on Amateur Radio Related Areas. Homebrewing, Weather, RACES, FCC Rules and Regs, general Ham Radio Aids, and the like. And if you would like to put up a home page at the site....well I may even be able to accomadate a few users for that purpose. The site will be maintaining a Ham Radio focus however.

This site is located in South Bend, Indiana. It's my hope that it will become a major link for Operators in the Michiana Area to keep in touch locally and worldwide.

See you on the site!

2490. First batch of MIC-Encoders at Dayton!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-11 00:00:00 UTC
From: Steve Stroh <strohs@halcyon.com>
Message-ID: <Pine.ULT.3.96.970511174855.6977A-100000@chinook.halcyon.com>
Source record: 30200

TAPR to offer first batch of TAPR APRS MIC-Encoders at Dayton!
May 9th, 1997

The MIC-E (Mic Encoder) installs between your radio mic and radio and allows your GPS unit to transmit APRS AX.25 frames at designated intervals without needing a TNC! Very useful in many settings.

See http://www.tapr.org/tapr/html/mic-e.html for full details and photos with project history and other interesting details.

The unit is a semi-kit. This means that the board has been partially assembled, but interface wires, box, and other items still require configuration and assembly before usage.

Units to be available at Dayton!

The first 150 units of the TAPR APRS MicEncoder will be available for sale at Dayton Hamvention! (That is if no catastrophic failure or act of God happens between now and the opening of Hamvention)

In order to handle the demand at the TAPR booth -- here is the deal:

* Units will be sold beginning at 12noon (opening) on Friday of HamVention.

* Until Saturday 12noon, TAPR members can only purchase up to 3 units per member. This is to allow as many as possible to get access to the 150 units available. If you are not a member, you can always join before getting your unit ;-)

* After Saturday 12noon, all non-members and TAPR members wanting additional units can purchase any units still available.

* No orders for units to be sold at Dayton
*** WILL BE TAKEN AT THE OFFICE EARLY ***

* If you are not going to be attending Dayton, you can use the TAPR order form to place an order for units not sold at Dayton or the subsequent production of more kits, which should happen shortly after Dayton (2-4 weeks).

* Orders will also be taken at Dayton for the subsequent production if the 150 units run out.

* There will be no s/h added to the kits sold at Dayton, but we will be adding the Ohio Sales Tax to all Dayton sales.

General Information

The price is:
$134.00 US for members of TAPR + s/h (this is the TAPR 10% discount)
or
$149 US for non-members +s/h

and will include:

* TAPR APRS MicEncoder with parts, cabinet, and documents
The assembly manual is available on the Web page listed above.

Discount for TAPR Members. The $134.00 purchase price for TAPR members represents the normal 10% membership discount.

Warranty. TAPR will provide replacement units for DOA units that are promptly reported by the purchaser within 90 days after TAPR ships.

Notice regarding TAPR APRS MicEncoder Purchases.

Shipping and Handling

* Shipping and Handling within the US will be $7.00 US by UPS Ground unless otherwise requested by purchaser.

* International Shipping will need to contact the TAPR office and get a quote on the shipping to your country. TAPR uses International Express Mail, unless the purchaser requires something else.

Discussion

As mobile GPS/APRS continues to grow, we can eliminate the need for every mobile to have a TNC, digital radio, and second antenna by simply integrating the position report into a very brief tone burst at the end of a voice transmission over any two-way radio. The APRS MIC-Encoder is this solution. With the MIC-E, no additional hardware is required in the vehicle, other than a GPS unit. The system not only reports position and vehicle type, but also one of 7 canned messages and 4 analog telemetry values.

Your APRS MIC-Encoder Unit will provide you a quick, easy means of tracking your mobile operations when properly interfaced with your existing voice radio. Before operating your MIC-E on the air, you should inquire about APRS operations in your immediate area. Check 145.79 MHz (U.S.), 144.39 Mhz (Canada), and some areas may also use 145.01 MHz. By contacting APRS users in your local area you may find particular voice repeaters that already support MIC-E operations with a cross-band link to the local APRS network.

In order to make the APRS LOCATOR SYSTEM practical, the MIC-ENCODER has been designed with several design concepts:

* Interfaces to UNMODIFIED radios via the MIC connector
* Uses standard AX.25 for compatibility with existing TNCs
* Compresses position report into about 0.3 seconds
* Uses low enough in power to be powered from the MIC jack
* Accepts the readily available NMEA output from GPS receivers
* Optionally provides 4 analog channels for telemetry

The result is a 1200 baud position report compressed to 32 bytes including beginning and ending FLAGS. This equates to about 320ms, including CALLSIGN, DIGIPEATER PATHS, and a minimum message capability. Plus, the packets are still receivable on ANY AX.25 TNC.

The MIC-E installs between your radio mic and radio and allows your GPS unit to transmit APRS AX.25 frames at designated intervals without needing a TNC! Very useful in many settings. Internal GPS units supported include the Garmin GPS-20, Motorola Oncore VP, Trimble, and others. Any external GPS can be used if it provides NMEA output.

The heart of the MIC-E is a PIC chip processor that is now sold commercially by Clements Eng. In 1996, Gwyn Reedy, W1BEL, President of PacComm approached TAPR about handling the amateur version in a semi-kit solution. The TAPR APRS MIC-E is the result of the collaborative process begun in October 1996 and finished in May of 1997.

APRS and MicEncoder are trademarks of Bob Bruninga, WB4APR.

2492. GPS databurst with voice transmission. How?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-11 00:00:00 UTC
From: jhoiby@azstarnet.com
Message-ID: <33766909.18508999@news.primenet.com>
Source record: 30202

Hi,

I'm a hang glider pilot and as part of the sport we freqently fly cross-country flights of 30 to >150 miles with a ground crew chasing us. Most serious XC pilots fly with a 2m ham radio and a GPS.

My question is how to use the 2m radio to automatically transmit GPS data to my ground crew as I am flying.

About 6 months or so ago someone mentioned that a hobbyist had made available a little encoder that took the data from the serial port of the GPS and automatically sent it in a short databurst at the end of each voice transmission. Another box in the ground vehicle took the data and output a serial stream to a notebook computer, which then used the data to display the gliders position on a constantly updated moving map display.

Has anyone heard of such a device, or know of a reasonably simple way to implement such a system?

The whole thing has to be small enough to fit in a largish harness pocket and run off batteries for up to 8 hours. The ground portion can be as complicated/power hungry as necessary, as long as it can be set up to run itself without too much assistance from a driver who is unfamiliar with the system.

Please cc: any responses to jhoiby@hoiby.com

Thanks in advance,

James Hoiby, KC7LAW

Message-ID: <MPG.de164c8624f328998968f@news.hlc.net>
Source record: 30112

Thanks for reading this message.

I have for sale a few items which are suitable for a packette
station.

Compact 286/12 "luggable" P/C. This unit has a plasma screen, 5.5"
drive, carring case, and all manuals, software and documentation. I also
have a CGA color monitor and a Panasonic KX-1124, 24 pin printer.

These units were used by my daughter in college. They were used
VERY lightly. As indication ... the printer still is on the original
ribbon.

I would like $190 for the complete package (plus shipping). If
interested, email me. Thanks

2496. Which ham terminal program?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-12 00:00:00 UTC
From: Rich Abbot <abbot@pez.bell-labs.com>
Message-ID: <337788E3.11F9@pez.bell-labs.com>
Source record: 30113

Hi,

There are dozens of DOS-based, ham radio oriented terminal
programs; I've downloaded and tried quite a few. I have
yet to find a program that meets the following four
requirements:

1. Not TNC-specific. Or, at a minimum, the user has a way
to prevent any spurious commands from being sent to the
TNC.

2. Split-screen operation (received data in one window,
keyboard data in another).

3. Character-oriented tx buffering as opposed to line
oriented. When in conversational mode, I want
each keyboard character to be sent to the TNC as
it is struck, without waiting for <ENTER>.

4. Has a keyboard macro or scripting language that includes
the ability to generate delays. For example, a string
such as "This text %D12% precedes this text by 12 seconds."
Here, the second part of the sentence would not be
transferred to the TNC until 12 seconds have elapsed.

I've come pretty close in my search. The SimpTerm program
has (1,2,3) above, but not 4. The PAKET program has (1,2,4),
but not 3. Good-quality PC terminal programs like Procomm
have (1,3,4) but not 2. XPCOM is very popular, but as far
as I can tell, the user can not prevent a TNC-specific
initialization sequence from being sent (so no to #1).

Is anyone using a program that meets all four of these
criteria? I really appreciate the input.

Thanks and 73,

Rich, WB2MBM

Hi, we'll get right to the point. We operate one of the finest
quality custom color labs in the USA. To introduce you to our
service we're offering the following Internet enlargement special:

Your color negatives hand printed on Kodak Supra Professional
16x20 inch paper. All negatives printed full frame.
Exhibition quality and color corrected---send us any size color
negative (35mm up to 4x5 inches).

* * * * * * * * * *

16 x 20 inch color enlargement special
5 identical prints from same negative-------$79
10 identical prints from same negative------$129

* * * * * * * * * *

Most orders 1 to 2 days in the lab. Add $6 priority mail shipping;
international add $10. We accept Visa and Mastercharge.

Mail your negative(s) and payment to:

2502. XpWin 1.18 and AEA 2232

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-12 00:00:00 UTC
From: Eduardo Jacob <edu@kender.es>
Message-ID: <863434220.16669@dejanews.com>
Source record: 30206

Hello everybody and Gary Johnson it he reads this.

I own a 2nd hand AEA-DSP2232 and I have been playing with XPWIN version 1.14 and 1.18 (nice addition the SIAM option) and I am not able to put the VHF packet side of the program at work. The TNC works fine with Wisp (satellite tracking) and Winpack, for BBS access.

The problem is that the session I start with any packet node doesn't create any new window in the program (I think it should, as others programs that use the TNC in Host mode do), and the data I receive is mixed with the packets for other stations in the main VHF window. Also I have been told by other hams that after the connect-request, I don't transmit other packets (as if the soft is deaf for that connection). If I ask for a disconnect it transmits again . And I can see the disconnect.

I have been trying with "Mcon" on and off, with "users" 1 or 4, with "chswitc" $00 and $7c and with "DCDcon". I really don't understand what is happenning.

I really like the program but I would like getting it working before purchasing it. As a suggestion for Gary, the doc is rather sparse speaking about configuring the TNC (I think this point doesn't appear..) and the AEA-DSP2232 (with AEA now defunct, although purchased by timewave, is not very attractive) configuration is rather special with all those "radio", "vhf" and "modem" parameters that in many combinations don't give any result... You could perhaps clarify that point. If you give some informal information, I'll write you a FAQ for the AEA-DSP2232.

Best regards and hoping to hear very soon from you

Eduardo/EA2BAJ

Go to http://www.tapr.org/tapr/html/mic-e.html . The MIC-E (Mic
Encoder) will give you GPS data every time you key the mic,
and you can also set it to send position data every "X" seconds
or minutes.

Also check out http://www.paccomm.com/ . This company sells a unit
called the "Pico Packet" (and several other units). This TNC
(Terminal Node Controller) goes in series between the GPS and the
radio, and can be set to send location packets periodically.

Either of the above units can be received by a ground receiver with another TNC and Laptop running either a DOS or Windows version of "APRS" software. You can get information on APRS from the TAPR site (above) or from http://www.ccnet.com/~rwilkins/aprs.html .

Either of these programs will give you mapping.

2507. Anyone Still Using Windows 3.1?

Newsgroup: rec.radio.amateur.digital.misc

Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc

Gang:

We are about to release a couple of new Windows-based programs for the ham market. One of them requires 32-bit performance for best results, but we are considering making lower-end version for those still stuck on Windows 3.1.
How many still use Win 3.1? I know that on some very old machines there is little choice, but our sense is that use of the old 16-bit Windows is pretty limited. Anyone have a gut feel for Win3.1 usage among their friends, *especially in packet operation*?

Thanks for any info de Dave, K9XK.

>>There are dozens of DOS-based, ham radio oriented terminal
>>programs; I've downloaded and tried quite a few...

Sorry you had to waste your time with all those. NONE of them
match the full feature set of the programs from Interflex:

About InterFlex Systems and the GOLD Software Authors
- by Jeffrey Towle, WA4EGT
InterFlex Systems Design Corp.

Thanks for taking a look at this file. If you already own PkGOLD or
KaGOLD we want to thank you for your support. Other packet users
contemplating a software purchase should give our software a thorough
review. PkGOLD and KaGOLD are the most advanced software for AEA and
Kantronics TNCs.

Our multi-connect software has been around in various forms for several
years. The Packet_TERM Shareware program that appeared on CompuServe
was a multi-connect program, dating back several years ago. Since that
time, we have taken the concept of multi-connect software to great heights.

The software developers, WB6UUT and WA4EGT are both professional software
designers. Lynn, WB6UUT is a pioneer in packet radio software, designing
the first packet radio BBS system that is still in use today. Jeff, WA4EGT
is also a software designer and developer with commercial clients in the
Fortune top 50 companies. Together, and with the many fine suggestions
from the growing number of users, we believe that Pk/KaGOLD represents
the most sophisticated packet and all-mode programs available.

When you deal with InterFlex, you talk to the developers. As packet radio
enthusiasts ourselves, we demand the best software with the most features.
Our users tell us that GOLD is the best program available, and by a
considerable margin. With only a few months of commercial advertising,
we have thousands of users, from all over the world, including Asia,
Europe, South America, and elsewhere. When we came out with our first
upgrade from Packet-PLUS, our users snapped it up and gave us rave
Since then, we have added many new features.

We were the first to support the new AEA ROM upgrade for the maildrop
in the summer of 1990. We were the first to do binary file transfer on
the same connect as keyboard to keyboard conversation (we were doing
that in 1989). At the San Diego ARRL convention, AEA representatives were
telling people to buy our product, and we thank them for their support.
We have the first program to support the Kantrnonics V 5,6 and 7 ROM FULLY,
with TWO binary file transfer protocols, conferences, and more features
than any other program.

When you compare features, keep in mind that with GOLD (any version) you get the largest scroll back buffers of any program (as big as available memory), and the most powerful and useful DOS Shell command (you can execute any DOS command, including Batch files from the PkGOLD or KaGOLD command line). Our multi-connect capability is well thought out, and easy to understand and use. We made our multi-way conferencing easy too. Now, you can support round-table QSOs simply and easily and not miss any text.

Pk and Ka GOLD offers you Quick-Connects(tm), and intelligent NET/ROM node hopping, which means you pick your quick-connect target station, and the program does all the waiting between NET/ROM node connects, sending the appropriate connect commands at each node and showing you the progress, as well as signalling you in morse code if you desire. Managing multiple connects with "Smart Session Management" means you can forget the idea of "stream switching" and let the program lead you to the next session automatically.

If you've ever wondered "What's going on" well wonder no more. With continual Network View monitoring, you can see in an instant what's going on, who's hogging the channel, and what's being said, all at the same time that you're carrying on multiple sessions and/or multiple conferences.

No matter what display monitor you have, GOLD provides the support you want. You decide whether to have 25 or 43/50 lines on your screen if if your monitor and display card support it. You pick the colors on all classes of messages (incoming, outgoing, cut/paste, command entry, status information, etc.).

The program comes with many options "defaulted" to the way we use the program, to simplify your initial use of the software. You can explore the aspects of the program you find interesting at your own pace. Installation is simple. But to install the program quickly, and get on the air, nothing beats PkGOLD or KaGOLD for simplicity.

If you're ready for something powerful, fast, full-featured, and fun to use, get our PkGOLD MultiMode or Enhanced, or KaGOLD Dualport. For Kantronics TNCs, you must have version 5.01 ROM or later, or for Data Engine, version 2.0 or later. We carry the Kantronics ROM upgrades so you can get the ROMs and the latest KaGOLD direct from us.

Use your credit card, send us a FAX, or call for information:

Body handling: HTML body converted to readable text

http://www.hamradio-online.com - the all volunteer, online ham radio magazine is now read in 65 countries. Some of the feature stories we have now include:

Ham Files Suit Claiming He "Owns" An Amateur Radio Frequency
In an ongoing dispute in Southern California (USA), Ron Ames has filed a lawsuit against the Keller Peak Repeater Association (KPRA) claiming ownership of a sanctioned and coordinated repeater frequency.

13cm PSK transceiver for 1.2Mbit/s packet radio
Here, Matjaz Vidmar details his design of a 1.2 million bits per second digital radio for Amateur use.

Simulated Satellite Projects Using High Altitude Balloons
Operated by NASA in conjunction with AMSAT and local amateur radio groups, this project simulates many of the practices and remote observing challenges inherent in working with real satellites, and offers a unique hands-on experience for students in K-12 earth science, physical science, physics, electronics or aerospace classes.

Equipment Options for Medium and High-Speed Packet Radio
Here is an excellent summary of the hardware options available for constructing medium- to high-speed packet radio links (9600 bps to 56 kbps and beyond).

Ham Radio Operators: Communications of Last Resort
The Grand Forks North Dakota Herald reports on amateur radio in the flood stricken Red River Valley.

Discussion on Sunspots and Earth Climate
The sun-climate connection is something that's been talked about many times. It's like everybody knows there has to be some connection but no one can prove a good case. This time the evidence seems pretty compelling and we have a better handle on Earth's climate past.

And many more articles this month too!

Plus the best propagation resources you'll find on the Net; equipment specifications; product directory and other sites lists; disaster situation updates and so much more.

This is a free web site, run by volunteers. No ads. Since October 1995. There is a reason this is the world's leading amateur radio web site. Stop on by and enjoy!

Ed (KF7VY) and Kim (N7VPL) Mitchell

You may not be looking for a Windows Program, but Visual PacketPeT meets all of your needs and more, though the scripting (item number 4) on your list is only available in the full version; the others are all in the Lite version. If you have Windows, why not give it a try? Download from site below.

PC/Flexnet does this using i.e. the soundblaster. Or you may use a small
modem on the LPT port (PICPAR).

Have a look at these pages:

http://dl0td.afthd.th-darmstadt.de/~flexnet/

and http://dl0td.afthd.th-darmstadt.de/~flexnet/sm.html for the
soundblaster software.

I'm running Mac OS on PPC now, but am thinking about adding extra hard drive and install MkLinux for Mac.

Get this- local bookstore sells 7 CD set of MkLinux including gigabytes of extra stuff for $50.

On that basis alone, it may be hard to resist.

One big factor is that I am using Microsim 7.1 CAD suite and have come up against limits on eval version for designing variable BW constant CF crystal filters.

I have MacSpice, but has no nice GUI or schematic capture. The last time I used Spice on Unix was at Berkeley Evans hall basement using punch cards :) Does it now have nice GUI like Microsim??

Rob.

There are several telecom, and amateur radio logging applications for
the M100. Check out the library at:
http://www.the-dock.com/club100.html

If you know anyone at CompuServe, they still have a large library of
M100 software, some of which is ham related (GO TANDYLAP)

I have the following manuals for sale. They can be purchased individually, or if someone is interested in purchasing all of them, I'll certainly entertain a bid.

HAL CWR6850 Telereader Instruction Manual
HAL ST-5 RTTY Demodulator Instruction Manual
HAL ST-6 RTTY Demodulator Instruction Manual
HAL ST-5AS AutoStart Instruction Manual
HAL AK-1 AFSK Oscillator Instruction Manual
HAL CWR-670 Telereader Instruction Manual
HAL DSK-3100 Disk Storage Option Instruction Manual
HAL 425 Hz Discriminator Instruction Manual
HAL XTK-100 AFSK Oscillator Instruction Manual
HAL CT2100 Communications Terminal Instruction Manual (2 each)
HAL CT2200 Communications Terminal Instruction Manual
HAL DS2050 KSR Video Comm Terminal Instruction Manual
HAL ARQ-1000 Error Correction Terminal Instruction Manual (3 each)
HAL DS2000 KSR Video Comm Terminal Instruction Manual (2 each)
HAL ST-5000 Demodulator Instruction Manual
HAL ST-6000 FSK Demodulator Instruction Manual
HAL ID-1000 Repeater Identifier Instruction Manual
HAL RS-2100 RTTY Scope Instruction Manual
HAL ST-7000 HF Packet Radio Demodulator Instruction Manual (2 each)
HAL SPT-1 Spectra-Tune Tuning Indicator Instruction Manual
HAL SPT-2 Spectra-Tune Tuning Indicator Instruction Manual (2 each)
HAL DS3100 ASR Maintenance Manual
HAL MPT3100 Message Processor Terminal Instruction Manual
HAL PCI-2000 Personal Computer Interface Instruction Manual
HAL PCI-3000 Multi-Mode HF Data Modem Instruction Manual
HAL PC-AMTOR Operators Guide
HAL RMX-3100 Two Port Radio Data Switch Instruction Manual
HAL DS-3200 Radio Data Communications Terminal Instruction Manual
HAL DS-3200 DSRTTY Operators Manual
HAL DV-3000 Terminal Display Instruction Manual
HAL CRI-100/CRI-200 Computer RTTY/CW Interface Instruction Manual (2 each)
Yaesu FT-227R Memorizer Instruction Manual
ICOM IC-745 Schematic Only
ICOM IC-751 HF Transceiver Instruction Manual

2526. TAPR @ Dayton HamVention

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-13 00:00:00 UTC
From: Steve Stroh <strohs@halcyon.com>
Message-ID: <Pine.ULT.3.96.970513140257.5218A-100000@coho.halcyon.com>
Source record: 30136

Just a reminder that TAPR is doing a lot of things at Dayton and everyone is invited to attend and participate!

Full details are available at http://www.tapr.org/tapr/html/dayton.html with maps, schedules, and some other goodies.

Friday:
1pm - 4:20pm (ET) You can listen to the TAPR Digital Forum held at HamVention via http://www.tapr.org/tapr/html/daytonlive.html

7pm - Annual PacketBASH and TAPR Banquet
Speaker: Tom Clark, W3IWI will be the after dinner speaker with the topic of "Amateur Radio 2000: A Retrospective View of the Future" . Get your dinner ticket at the TAPR booth before 5pm Saturday and some walk ups can be accommodated.

There will be a book signing time before and after dinner with Tom McDermott, N5EG, on his new TAPR Wireless Digital Communications Book. Tom will also be available on Saturday to sign his book at the TAPR booth.

Saturday:
3pm - 5pm (ET), TAPR will be providing audio from the Open Town Meeting hosted by Len Winkler, KB7LPW.
http://www.tapr.org/newsline/townmeeting.html This will be the third such live audio amateur radio meeting made available by TAPR at an amateur radio conference.

The TAPR booth will be at its normal location. We will have 150 MIC-E units available along with a few other various TAPR kits, CD-ROM, publications, and more!

2527. TNC2 : hardware, software diagram?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-13 00:00:00 UTC
From: Ken Harris <kjh@shoreline-studios.com>
Message-ID: <3378DF19.41C6@shoreline-studios.com>
Source record: 30137

I have some questions about the TNC2 PROMS:

I have an AEA PK80 (w/ 1.1.2 PROMS). The TAPR 1.1.9 PROMS will work in this, right (I upgraded the RAM)?

What's the difference between the $12 TNC2 KISS PROM and the $15 TNC2 1.1.9 w/KISS PROM (sold by TAPR)?

Can you give me a reference for a detailed description of the TNC software? I'm interested in at least a block diagram and some idea of what each parameters affects and also a block diagram of the KISS mode. Source code might be nice (both Z80 assembler and C?). I'm also interested in how the calibration mode is implemented.

Also, can you give me a reference for a hardware block diagram (and schematic) for the TNC2?

Also, there seems to be a way to run the modem at 300 baud. Is this for HF? If so, what protocols can it do? I thought it could only do AX.25, so I don't think it can do RTTY or AMTOR, right?

Also, can this TNC do full duplex (with a 9600 bps modem)?

2530. petition

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-13 00:00:00 UTC
From: KA8YKK <KA8YKK@concentric.net>
Message-ID: <3378D28F.5E3E@concentric.net>
Source record: 30140

Please forward to all amateur radio operators

I am circulating this petition across the state of Michigan. Anyone wishing to join in on this petition can change it from the state of michigan and change it to their own state. You can also down load it off my web page http://www.concentric.net/~ka8ykk

Amateur Radio Operators
>From the State of Michigan
We the Amateur Radio operators from the State of Michigan do hereby agree to continue to abide by all the rules of Amateur Radio. We pledge to improve the amateur radio bands, and teach new hams joining the hobby the correct operating procedures which should be followed on the amateur bands. By doing this, we are petitioning the American Radio Relay League in our fight to help clean up the language on the Amateur bands, and are looking for civility/politeness in conversations. By showing our support in this petition, we are hoping that the American Radio Relay League can help us fight the language that we are hearing on these bands.

We are asking the American Radio Relay League to help in this clean up by: Hosting several national forums on this problem, and how it can be addressed, We are looking for a promise from the ARRL to report on how enforcement is currently done. We are also looking for a promise from the ARRL to create a sort of self enforcement mechanism, and possibly create a large fine mechanism that will generate enough money to help correct this problem. We realize there is such a thing as freedom of speech but, there are also the words such as civility, and politeness.

I Deborah K. Kirkbride KA8YKK am asking all amateurs in the State of Michigan to please sign this petition, and send it to me at the following address: 1315 Center Avenue, Apartment #1 Bay City, MI 48708. I will in turn when enough signatures are gathered be sending all petitions received to the ARRL.
Please make copies of this petition and pass it along to other clubs, and Amateurs in you area. Please help me in this fight to get the Amateur Bands back on the right track and keep them there.

2531. KAM Plus software advice wanted

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-14 00:00:00 UTC
From: mtanner@dns.city-net.com
Message-ID: <337939ca.1819747@news.city-net.com>
Source record: 30141

Hi folks, I just got a Kam Plus and I'm looking for a DOS based
software package that will support all the major HF modes as well as
ansi graphics and colors. A friend on the air told me he uses XPKAM
but I couldn't find it on the web anywhere.

Hopefully within a couple of months I'll be upgrading my radio PC to a
486/66, but for now I have a 386/16 with 8Mb RAM.

I've tried Lan-Link 2.32, Host Master Plus, and a myriad of terminal
emulators but none of them support the extended graphics set so all
the pretty pictures people make for "on the air" QSL's 'n stuff just
looks like garbage to me!

If you have any suggestions, please forward them on to me at
mtanner@dns.city-net.com
Tnx es best 73's

Jeremy,
The Mod. 100 will work very well with the communications program that
is built in. Any of the TAPR Clone TNC's like the MFJ-1270 etc.
1200 baud Packet will work just fine. Since this is your first venture
into Packet it may take some persistance getting the Mod. 100 and the
TNC talking to each other but IT WILL WORK!
I used one for a couple of years but that's been a good while ago!
Good Luck!
de AE4Q

For packet your options are pretty much limited to DOS _OR_ Win95/NT. Win
3.x is such a lousy multitasker that it is useless platform for serial
comms.

Just my five cents worth.

PS: more seriously, everybody I know either use DOS or a 32-bit platform
for this type of use. I know of a few people still running 3.x for office
aut. type of apps, only because of inadequate resources for Win32/NT.

Peter:

Thanks to you and everyone else who replied. Unfortunately, we will probably need to serve the Win3.1 market as well, and that *may* limit our feature set. I have received lots of responses that suggest that PC boatanchors end up in the shack, thus lots of them are running DOS and Win3.1. Most people I know run a little higher-end setup, so I was curious.

We'll see what it will take to address the needs of Win3.1 users.

I still use Win 3.1. I dislike Win 95 because you can never exit the program, you're always in it. I prefer to have some control over my computer rather than a software program having ALL the control.

I have friends who have Win 95 simply because they bought new computers and it came with them. I have helped them on numerous occassions to fix problems they were having with Win 95 and it is a real pain in the a** diagnosing a prob on Win 95. I have had few probs diagnosing software probs on Win 3.1.

BTW, since you want your software to be 32 bit, why not make it compatible with Win 32s so us lowly Win 3.1 users can use it.

Mike your friends advice was good. I also use XP-Kam and it is an
excellent program - there is also a new version out for windows, but I
haven't tried it yet, The dos program works fine in windows 95.
The program is written by Gary L Johnson KF7XP and his e-mail address
is gjohnson@indirect.com. He is very helpful and I am sure you will
get an answer if you contact him. I am sure he has a web page as well
where you can down-load a copy that is good for 100 start ups to try
it. Good Luck and best 73 Bob VY2RO

Try KaGold. There's a demo version (fully working, it just stops running
after 10 minutes) on the http://www.interflex.com web site. I've been
using KaGold for years and am happy with it. It does all you ask for, and
more.

I'm not surprised, I saw somewhere recently that there are still significant
sales of Win 3.1. Some people took exception to certain networking features
of Win 95, particularly educational establishments where the kids can get
up to all sorts of tricks with Win95. Perhaps they have sorted those
problems out now, I haven't checked recently.
Us Win 3.1 users can feel smug that we're immune from malicious Java code,
Active X controls, Out-of-band port 139 attacks, etc.
Given that you can get an old DOS/Win machine like the AT for about GBP 40-50
or less, which is quite sufficient to run basic comms functions in the shack,
it makes a lot of sense that there is a significant installed base of Win3
machines. Another thing is that if you develop software for the latest
machines but you want to check compatibility of the 16 bit version with older
machines, there is nothing better than having a real old machine to test it
on.

Is there anything to stop you from producing a fully featured Win95+ product
but restricting the win3.1 product feature set by use of conditional
compiler directives or whatever?

Right you are ... forgotten already ...

>
> P.S.
>
> It is spelled "renaisance" yeah, yeah I know, why learn to spell when
> spell checkers are the current technology?

Actually ... I don't exactly have a spelling problem ... it's more that I
have
a problem with fine motor coordination and sensation in my hands and
fingers as a result of a spinal chord injury ...

Note, I'm not claiming to be the national spelling bee champ or anything,
just pointing out that sometimes my fingers trip all over themselves and
don't do exactly what I told them to do (sometimes they hit the right keys,
but in the wrong order, sometimes they miss a key or two, and sometimes
they hit adjacent keys)

Prior to the injury, I could type a solid 60wpm ... now I can hardly do
35-40
and that's seldom 100% error free ... I have to either slow *way* down or
use
a spell-checker to find the blunders ...

I am loath to invest a lot of extra time in chit-chat here, so I haven't
been
inclined to slow down to a snail's pace, and my newsreader doesn't
have a spell-checker ... so I guess you'll have to learn to live with my
imprefections as I have ...

73,
Carl - wa6vse
wa6vse@fast.net

p.s. If you doubt the veracity of my "excuse", I'd be quite happy to send
you a GIF or JPEG of the MRI from the neurosurgeon's letter to my primary
physician, clearly showing the spinal chord compression at C5-6 ...

Jeremy,

I am successfully running packet on a Tandy 102 (very similar to a 100). I am using a Kantronics KPC-3+ TNC (around $120). I recommend this TNC because it can run on a 9V battery - so with this TNC and your portable 100 computer you can easily go mobile.

A TNC is just like a regular modem in that you send it commands through the serial port of the PC (the command mode), and then you are connected directly to another system. For example, on a regular modem you might type "ATDT 555-1212" to call a bulletin board or other system. Once connected, everything you type goes to the other system until you type the escape characters (usually +++). On a TNC, you generally type something like "C DXBBS", once your radio is on frequency. You are then connected and anything you type goes to the system until you type the escape character (usually ^C).

Now, just like with regular modems, you can get specialized programs that take care of TNC commands for you at the push of a function key. But you should be able to do just fine with the 100's built-in terminal program.

Hope this helps, and 73.

RedHat is pathetically easy to set up; however, I would not advocate
dumping a perfectly good Slackware distribution to run the RedHat.
Slackware's rc files, bootup scripts, and config files are much better
kept than RedHat's, which, in my opinion, are needlessly scattered
into too many subdirectories.

: modem. It is working, but its performance is quite poor when compared with
: the JNOS/DOS system, because there are much more lost packets, especially
: if they are too long.
: I think it is due to the Linux's multitasking capability, but I
: may be missing something.
: Is there any way to improve this modem's performance with Linux?
: Some parameter tuning?

Hi Luis (Vou escrever em Ingles para que os outros colegas percebam)

As you know baycom modem is only a MODEM without any kind of TNC
all the protocol or even noise is analysed by the computer.
To do this your PC has to generate lots of interrupts on the
serial interface wich makes the machine a little bit slower...
If you run any other aplication (using the HDD etc ...)
it will crash the input and then errors will occur ...,
Do a cat to /proc/interrupts and see how much times the computer
goes to the serial interface to check out new data !?

the best way it's to get a modem+tnc and then it will be real
better.

don't run much applications while you're using baycom it will
affect your modem performance .

Try the new ax25-utils and new kernel 2.0.30 , maybe it's
something better

You're kidding, right? Yeah, you *must* be! No one would state that in all seriousness.

> Your argument is the same as "Why learn to add and subtract? calculators
> are less than 5 dollars, why learn to read, everyone has a TV"

It can be argued that knowing how to add and subtract, and read, is somewhat of a necessity in order to be able to live in today's society. Knowing CW certainly isn't. Neither does knowing the code make one a "good amateur radio operator" -- listen in to the crap on 75m phone once in a while for evidence of this, only "know coders" there! CW is but *one* mode of operation, and one mode whose use is declining the world over because better modes are taking over. It makes no sense whatsoever to judge an applicant's ability to contribute to the Amateur Service, via their technological know-how, or other people-oriented service, based soley on his/her ability to use one particular (outdated) mode!

PROBLEM: Unable to operate packet on IBM P90 after using DXTelnet.

PRIOR ACTIVITY:

o Connected MegaCluster with local node using DXTelnet and left it unattended for a
few hours; returned and had error message that said something about stack or
buffer full; used IBM P90.
o I may have configured DXTNC and TXTelnet to use same port ... sigh !!!
o Unable to connect to any stations after failure using IBM P90.
o Able to connect to stations using another computer (486/66) using same tnc/radio.

I am not computer smart so please be gentle with your comments ... thanks.

Dave,

This might not apply to you but might interest others interested in
making software for the ham market.

If your program is doing something useful (and not just running the
user interface) and you need a lot of memory, it might be possible to
use a DOS extender to write 32 bit code for any 386+ running MS-DOS or
higher. At least the Gnu-C and Watcom C/C++ compiler packages include
some DOS-extenders.

Kam v8.0e Firmware and Front Panel?

I'm Spring Cleaning and undergoing other major shack changes.
As a result, I recently purchased a used Kantronics KAM all mode:
S/N 11K01-02340

Looks like a very nice unit, but the previous owner drilled a
small hole in the *front panel* for a reset switch and it has
the version 7 firmware (on a daughter card inside).

Anyway 4 questions:
1) Have info below, but is there an 800 number?
2) Where can I get the ver 8.0e firmware to upgrade?
3) Where can I get a new front panel?
4) I guess the daughter card makes it a Kam+ ?

I am sorry, Can't help adding to the age old argument with the same old *&$

but, if someone is too lazy or too stupid to learn something as simple as
code,
what possible contribution can the make in any field.
Your argument is the same as "Why learn to add and subtract? calculators
are less than 5 dollars, why learn to read, everyone has a TV" It always
amazes me that there are people willing to spend time and effort defending
why they shouldn't learn something.

Sorry everyone, don't want to start a flame war -- forget what I said- just
dinosaur talk.

P.S.

It is spelled "renaisance" yeah, yeah I know, why learn to spell when
spell checkers are the current technology?

I have both Win 3.1 and Win 95 on two of my computers which are accessed using System Commander so my choice of OS is quite easy. The fact is that I choose Win 3.1 95% of the time since I find it much easier to use, adjust and modify. In addition Win 3.1 usually operates much faster from boot up though shut down. That's my opinion for what it's worth.

This message is to announce the new Home Page for the Heartland
AMateur Packet Society (HAmPS). The URL is:

http://www.geocities.com/CapeCanaveral/Lab/7067

HAmPS is mainly aimed at packet operators in the Heartland of the
United States, but membership is open to all interested parties.

HAmPS features:

No Officers
No Meetings
No Dues!

Stop by for more complete information.

Take Care & 73

2564. Spy people on the Net

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-16 00:00:00 UTC
From: benh@hotmail.com
Message-ID: <337b9d38.5349859@bang-olufsen.dk>
Source record: 30074

I present here my two most recent software which I hope they interest you.
they are progammed by Turbo C++ and run under Windows(3.11 and 95).
here is a short description of these two software.

1-Robot Spy 1.0
at my knowledge, this software is the first and the unique of its kind.
This software allow you to spy your friends who are on the net at the same time
of you, it permits to see exactly what they do on their screen, pixel by pixel,
anywhere, in the world, at the condition they are connected to the internet.
how does-it work?
it's simple, you send a file to the person you want to spy telling to him it's a
game or everythings else, the objectif is this person run the file. from this time,
a batch file is installed on his computor, and everytime this person use internet,
this batch connects him secretly on our server.
on your side, you , after the installation of the other part of the software every time
you want, you can connect on our server with your password and have the list of all the
persons who received your batch and who are connected at this time.
the only thing you have to do is to click on the name of the person you want to spy.
a window opens containing exactly the screen of the person spied, you can have
ten pictures per second with 256 colors, if you switch to balck and white mode you can
onbtain a real time sequence, approximatly 30 pictures by second.

Robot Mailer 1.1
The message you are reading presently is sent to more then 20,000 newsgroups with
this software. This program automates FreeAgent, and reach with a connection of 28,8 Kbauds
5,000 news per hours. It can also find a maximum of 50,000 e-mail adresses from internet
and
send a message in 4 or 5 hours. You can obtain with this sofware the most powerful tool of
mass transmittion on the internet.

Robot Spy 1.0.................20 US$
Robot Mailer 1.1.............20 US$
Both.............................30 US$

I'm sorry i can't accept credit card, but you can send an international money order to:

Ben Hedi Nassef
1481 Ste-Catherine est #7
Montreal, PQ, H2L-2H9
Canada

Don't forget to include your e-mail on a paper, you receice the software ordered in your
e-mail the day we receive the money order.

2565. Re: Kam v8.0e Firmware and Front Panel?

>Looks like a very nice unit, but the previous owner drilled a
>small hole in the *front panel* for a reset switch and it has
>the version 7 firmware (on a daughter card inside).
>

>Anyway 4 questions:
>1) Have info below, but is there an 800 number?
No, there isn't an 800 number.

>2) Where can I get the ver 8.0e firmware to upgrade?
Some dealers carry the 8.0E firmware, or you can order it direct from
Kantronics.

>3) Where can I get a new front panel?
Yes, but this will be a direct from Kantronics item. I'm sure dealers
don't carry this part.

>4) I guess the daughter card makes it a Kam+ ?
Not really - It's still a KAM (Enhanced), but it has all the software
features of the Kam Plus. You'll still be missing a separate
mail-waiting LED and the KAM can only have 128K RAM whereas the KAM
Plus can go to 512K.

2566. When are we going to Kick start packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-16 00:00:00 UTC
From: Matt Green <Matt.Green@shef.ac.uk>
Message-ID: <337C4E69.716F@shef.ac.uk>
Source record: 30076

What I want to know is when are we (the radio amateur community) going to kick start packect radio and bring it up to date?

Once we increase the data links speed we can use http to send decent information to each other!

ANy comments?

Matt Green (G7PFI)

2567. Re: When are we going to Kick start packet?

Newsgroup: rec.radio.amateur.digital.misc

Message-ID: <337C5EC7.4166@cool.site.net>
Source record: 30077

Here's how it works:

1. Two men get together and build something.
2. The community likes the idea and wants to join.
3. The idea is a success.

So here's what you need to do:

1. Analyze the problem:

A. Packet Radio is too slow.
a. Packet Radio bandwidth is too narrow.

2. Find a solution to the problem.

A. Compress the data.
a. Still too slow.
B. Reduce the number of links (latency)
a. Still too slow.
C. Increase the bandwidth.
a. Great Idea!

How do you increase the bandwidth? Right now, you do it with money.
The best solution is Spread Spectrum modulation. Just like SSB wiped
out AM on HF, we need to deploy SS to wipe out SSB. On VHF and up, we
need to wipe out FM. Hams need to deploy SS and get the rules changed.
We are operating with rules designed in the early 60's, while technology
has passed us by. Partly this is because the U.S. Government has
run the worldwide rule-making events (we offer money and aid to
countries who side with us), and the ARRL is the PAC that tells them
how to write the Ham rules. When you see on old Ham with a screwy
looking baseball cap, buttons, and a pocket protector, ask him if
he'll sign your Spread Spectrum rules change petition :-)

At any rate, SS is the answer to your problem, but the rules don't
allow it (or only a crippled version, on bands that don't propagate.)

Suggest you use morse code and and AM at 800 Watts until then.

I have bought a LPD radio from ALINCO. The name is EC10.
The low power device has 10mW output power.

Let me know, how to change to change the output power from 10mW to 50 or
400mW.
Is the frequency after the change the same?

Jochen

The sad fact is that, as far as the UK is concerned, there was far more
experimentation taking place on packet in the early 1980s than there is
today. I think that, at least in this country, the mode has been
effectively hijacked by people who are more interested in policing it
than in trying anything new.

Bang on the nose Roger, our newsgroups are full of the outpourings of
these NET LAWYERS, I recently posted an article saying that if we don't
make better use of the frequencies, we are likely to see them sold off
to people who would show us just how valuable they are and make us pay
handsomely for the privilige.
I used to proudly mention packet radio to people, now there is now way
I'll do that, they'd die laughing if they saw 1k2 in operation.

Problem is, people expect packet to be as fast as the net. I have no problem with 1200 baud packet. I'm not expecting a speedy service from it. When I want speed I go on the net. What's everyone big hurry anyway using packet? Use it and enjoy it, 1200 baud isn't so bad for packet to me anyway.

If you're looking for a Windows 95/WindowsNT program to control your Yaesu FT-990 radio, I've decided to offer my MasterControl 990 as shareware. The features are noted on my MasterControl 990 home page at http://prairie.lakes.com/~medcalf/

You'll need an RS-232 to TTL adapter to talk to the FT-990, and one available COM port on your computer (the program supports COM 1 through COM 9). The shareware registration is only $25.00 and I'll be happy to consider all suggestions for improvements from registered users.

> Problem is, people expect packet to be as fast as the net.

And why shouldn't it be??? Why should hams stagnate with thechnology
that's well over a decade old, when new, competitive stuff would cost the
same or less in mass production? Anyone who argues that "faster packet
stuff would be too expensive" obviously hasn't a clue as to the technical
realities ... a 100 MIPS DSP is under $5 in volume these days ...

> I have no problem with 1200 baud packet.

You should ... it's a terrible waste of valuable frequencies.

> I'm not expecting a speedy service from it.

You should be ... in fact, you should be participating in making it so ...
instead of sitting around yawning and saying "why bother?, if I want
faster, I'll use the net ..."

> What's everyone big hurry anyway using packet? Use it
> and enjoy it, 1200 baud isn't so bad for packet to me anyway.

1200 baud packet is a total, complete abomination today ...
it's an embarassment, or should be ... the only reason it's not
perceived that way by more hams is that vast numbers are so
far behind the power curve of technology that they don't have
the wisdom and sense to realize how embarrasing it actually is.

I have a question on the behalf of a friend of mine.
How do you connect a serial communication interface (cable) to
an ICOM IC-P2E? I have two cables connected from the radio (mic and
speaker) to the modem. I have a Baycom micro-modem, that is connected
through a 9 pin serial con. I wonder which treads from the two cables
should be connected to which pins (in the 9 pin serial)?

you are right that suitable technology is not the primary barrier to
much better amateur packet systems ... poor judgement and
lack of knowledge on the part of the majority of the ham community
and outdated rules that get in the way of the ambitious few amongst
us are problems ...

> but finding the last remaining few hams who are able to construct
> something themselves and are willing to spend the money and effort
> in an environment where 99% of the users do not contribute at all.

this is also becoming a problem ... the two are different, but come
together
as a source of frustration for the dwindling number of hams who ARE capable
of doing something creative with technology, rather than simply pushing
buttons on some rice box ...

>Thanks for any info de Dave, K9XK.

You have seen there are many out there still using W3.1 (3.10, 3.11).
Most W3.1 users have internet access and 16Mb or more. Companies like
Georgia Pacific are still heavy 3.1, too.

Most propagation, antenna modeling, and the like are still DOS. Same
for the major logging programs. I'll bet 80% of the packet computers
are still DOS.

But please don't confuse W3.1 with completely DOS boxes. DOS boxes
are usually 4MB XMS or less (50% are 640KB machines). W3.1 are 16Mb
or 32MB usually. The reason W95 is so strong is you can't get a new
PC with anything but W95. One place charges $99 to load W3.11

Hope this helps

Dave K4JRB

IMO, the only thing 1200 baud packet is marginally usable, is the
DX-cluster. The amount of data to be transferred is minimal and it
does not matter if the message is delayed for a while, since it just
helps spreading the pile-up for the DX-station anyway :-). Completely
separate questions are the desirability of DX-clusters in general and
the dreadful connected oriented protocol used by the DX-cluster to
distribute these messages.

Very true.

In my experience, high speed wireless links suffer twice from this same problem as they usually require some "home brewing" both on the RF analog hardware side and on the computer software side. Finding two hams within line of sight that are willing and able to set up a high speed networking path is a rare thing.

The US had a great organization TAPR as a focal point for packet here in the US. I think TAPR can be credited with the slow death of new technology in the US. They seem to be stuck on spread spectrum, which is out of the reach of most of the hams, and is too political for some others. All the current radio manufactures have included 9600 baud on almost all their radios, yet very little 9600 baud is in use. There are only a handfull of manufacturs of TNC's that include 9600 as standard, and TAPR has not pushed this mode as I think they should. Packet is not the net, it is much simpler, cleaner, and cheaper.

What I would like to see is a good effort to upgrade the exsisting packet network with hardware that a normal ham can understand, and even work on, and forget about the spread spectrum stuff. To make spread spectrum work, we need a cheap standard radio (Which does not exsist today) and a real use for it. We have many hams in our area on packet, and the net, and packet is still the prefered way to pass messages to one another. 9600 would be nice, but I cant read much faster than 1200 anyway.

I would like to know what packet radio is good for. I been trying to use packet for over 2 years and have yet been able to make a contact. I've try hf , but was told that calling CQ on hf with packet was useless. I've tried 2 meters with the same results. Oh there is a packet repeater in the area but either no one knows how to use it or no one is telling.

So does anyone out there got any ideas

If so email me at jam@comsource.net

I agree whole-heartedly, Paul. I have on many occasions characaterized
the DX Cluster as "an abbomination." You are dead-bang right on about
the protocol being a real "gag me with s spoon" affair ...

Well, I use OS/2 Warp 4 myself . . .but I will mention that Win95 is selling like coldcakes among those with mission-critical apps.

In fact, last week, I installed 20 computers for DHL Worldwide. Top HP CPUs, 17" monitors, high-speed network . . .and Windows 3.11 -- though they were forced to buy a copy of Win95 for each system, these were tossed into a box to be stored somewhere.

Go to a club meeting, or invite a local Ham over to show you the ropes.
It's more fun when 2 people do it.

I'm using win3.1 on this PC I'm using to read and write these usenews newsgroups. This machine is behaving reasonably well, and don't want to "risk" the problems I might get if I upgrade to win95. I also have a win32s subdirectory in windows with wahtever Photoshop 3.04 wanted to install to run properly.

Of course, my next machine will be win95 (or whatever Microsoft puts out next, win98?) and would be a "clean slate" to load programs into.

Agreed. That is why I am so interested in the part 15 devices that
operate in the amature band! Of course to make them much more effective
(operate them under part 97 rules), we need the FCC to make some rule
changes. But off the shelf part 15 devices have volume production advantages
that can make them much cheaper than any item produced only for the amature
market.

>and a real use for it. We
>have many hams in our area on packet, and the net, and packet is still the
>prefered way to pass messages to one another. 9600 would be nice, but I cant
>read much faster than 1200 anyway.

This is what I think is the REAL problem with packet! APPLICATIONS!
In this area (Baltimore / Washington area), the only two applications for
packet that have any use at all, are APRS, and Packet Cluster. Not everyone
is interested in either of these modes, so new applications are needed to
attract new people to packet radio. More publicity would help draw people
to the existing applications (like APRS, and EXCELLENT use for packet, that
can't be done very effectivly with a wire phone line, and the Internet!)

It is really tough for packet radio (1200 or 9600 baud, shared channel,
half duplex, noisy channel) to compete at all with a 28.8K dial up phone line!
So duplicating Internet services are kind of pointless unless the specail
characteristics of amature radio are needed (like mobile use, or higher
bandwidth like 1Mbps or more), that can not be met easily by other means.

2599. Beta Testers Needed For LOS+ Software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-19 00:00:00 UTC
From: n2ckh@cybercomm.net
Message-ID: <338019a8.71659463@news.cybercomm.net>
Source record: 30011

Hello All,

This message serves to announce to the Amateur community
Sight It!(tm) the first and only known Geographical
Information System designed specifically for Amateur Radio.

At present Sight It! is in Alpha, and being tested by a few
hardy Amateurs in a half dozen different states. Within one
to two months the software will be in Beta, which is my
reason for this message. I need two licensed Amateurs from
each state to volunteer as beta (even Alpha) testers.

The software is a high end application, it requires at a
minimum a high end 486 computer, with at least 16MB RAM and SVGA
graphics. Futhermore, the data supported requires that all
Beta (and Alpha) testers have Internet Browser or FTP access
to get Digital Elevation Model data sets from the US Geological
Survey (USGS) and Digital Terrain Elevation Data from the
National Image and Mapping Agency (NIMA).

The application is a true 32 bit MS-Windows 95/Windows NT
program, coded using the latest Visual C/C++ v5.0 tools
and techniques.

A preliminary beta tester application is available at bootom of
the main page of my website at:

http://www.QTH.com/n2ckh.bytewise.org

Also at my website is additional information and screen
captures from the Alpha version of Sight It!, just follow
the Sight It! hyperlinks.

The beta tester positions will be filled on a first come, meet
all my requirments, first serve basis. All applicants will
receive a return e-mail in due order informing them of their
application status.

Some of the features planned for Sight It! (with 80% already
coded and working well) will include but are not limited to:

The display USGS DEM(s) for a chosen ROI in three modes,
Topographic, Color or Shaded and in combinations of the three.

Allow the user to configure the color bins for range and custom
color, with all color bins created optionally saved as a recallable
color bin separate from or tied to the DEM it was created with for
later automatic or manually selected reuse.

Use the mouse pointer (crosshairs) to position any coordinate on screen with real time display of the user selection of coordinate system.

Display coordinates in Latitude/Longitude (Lat/Lon), Universal Transverse Mercatur (UTM), World Geographic Reference System (GeoRef), Maiden Head Grid Squares and the Military Grid Reference System (MGRS).

Display Geomagnetic Delcination (Grid Declination) coordinates.

Determine the Elevation at a given coordinate in either meters or feet.

Perform Optical Line of Sight (LOS) calculations between any two geographical points within a DEM.

Perform Radio Line of Sight (R.LOS) calculations between any two geographical points within a DEM.

Perform Path Loss calculations between any two points within the loaded DEM.

Determine Bearing, Distance and Elevation with or without Height Above Ground Level (HAGL) of an antenna system taking into account between any two points within the loaded DEM.

Display bearing in either Degrees or Mils.

Display distances in both Kilometers and Miles between any two points within a DEM.

Perform Height Above Average Terrain (HAAT) calculation for any point within the loaded DEM, displaying the 40 point 8 compass point pattern as an overlay to the DEM and the HAAT derived value. Optionally print an HAAT report for inclusion with repeater documentation.

Determine the Distance to the Radio Horizon (DTRH) taking into account the user entered antenna height at that location while calculating HAAT.

Determine the Distance to the Common Radio Horizon between to points, taking into consideration the user entered antenna height at both locations.

Display a 360 degree fan of LOS or R.LOS, with a user selected radius distance, with or without HAGL taking into consideration for any point within a DEM.

Use a Global Positioning Receiver (GPS) having a NMEA-183 port or standard RS-232C output attached to the host PCs RS-232C port for user selection as a point reference.

Interface to Packet TNCs for geographical information to display on the DEM georeferenced for all stations heard, with callsign

displayed on the DEM for all that fall within the coverage area of the DEM in use, a separate drop down list of all stations heard is also provided. The plan is to provide full APRS support.

Interface to the Radio Amateur Callbook, Inc. CD-ROM Callbook to lookup amateurs by callsign for georefering within the DEM in use to the relative postal zone coordinates provided in the database.

Display various overlay layers of georeference data, such as County Names and City Names within the DEM referenced to a user editable database that will allow the use to not only turn individual Cities that we provide On or Off, but will also allow the user to enter additional geographic locations with a Name and set of Coordinates.

Display political boundaries such as County and State outlines referenced to the actual coordinates of the borders of said boundaries.

Support user drawn annotation with Letters, Numbers, Lines, Circles, Rectangles and Polygons in user selectable sizes, widths and colors. Also user selected Icons to respent buildings, antennas, towers, vehicles, etc.

Print to any MS-Windows compatible Graphics Printer.

Copy to the clip board the currently displayed DEM.

Save imaged data to disks files formats which include: JPG, CMP, TIFF, MPT, BMP, PCX, PNG, TGA, EPS, RAS, WPG, PCT.

/s/ Steve, N2CKH

Very interesting !
Being a sysop of a packet node (PI1EHV) with 9 23cm point-to-point
links to maintain, i'd love to be able to use such a tool.

However... i guess these databases at USGS and NIMA won't be covering
Europe. Does anybody has a non-commercial solution for calculating
point-to-point rf paths ?

Ah, TAPR...

If the stories I'm reading can be believed, the head of TAPR is
actively involved in destroying the radio-based packet network by the
promotion of the Internet as the primary method of moving data and
messages on the "ham" packet network. This is NOT a very healthy
thing for Amateur Radio, is it?

TAPR has done some good things for our packet system in the past, but
I haven't seen much evidence that it's doing much of anything
productive in recent years.

Hardly anyone uses packet for live contacts. Most use it for BBS' or packet clusters and APRS. Once in a GREAT while I'll have a live QSO but it's rare. The only advise I can give is to beacon your id say every 8-10 mins., that's all you can really do except wait until you see someone disconnect then try to connect to them.

Here in London three of us are running systems at 9600 baud, which are linked via K-Net (net-rom alike s/ware). At the moment we are parked on 433.600 MHz.

We started for exactly the reasons you suggest ... to stop others sayig there was no reason to upgrade, and for BBS operators then to say there was no user demand.
G7LGW in Woolwich <-> G7LTQ Leyton <-> G4UDT Wembley
All operational 24 hours a day 433.600 MHz at 9600 baud.

John Newgas G7LTQ in UK / N2UYI in USA

> 9600 would be nice, but I cant read much faster than 1200 anyway.

Go rent a clue ... I doubt you can read (or type) at 1200 ... the point
is that data xfers are much faster and QSOs can be time multiplexed
so that more people can use the channel with the appearance that
they all have their own channel ... (without interfering with each other)

Try opening your mind a bit and having at least a slight idea of what
the heck you're talking about before opening your mouth and showing

Hi ...

I've been using packet radio for years to time-delay
messages to and from my friends. We do club work over
packet. We keep in touch. When I'm out camping I stay
in touch with friends and family with HF Pactor. I love it but
I have a use for it.

It kinda sounds like you have no real use.

Cheers everyone for answering me on my original posting. It seems like
the camp is split two ways:

a) those who can see the need for higher data speeds and

b) those who can't!

What is missing from some people is the lack of amateur spirit but then
I guess the spirit is "do as much or as little as you want" it is a
hobby after all!

We are sitting WELL behind current technology, we should have really
good networks by now-

- no real estate problems
- little licensing problems (here in the UK it is 12pounds/annum),
compare this with commercial licences!

Sureley in the true amateur tradition we should be homebrewing gear at a
cost that is as low as possible (this is the spirit of ham radio!)
I think the issues go beyond technical problems on this one.......

Oh, oh, oh! Another primitive puritan who has inadvertently substituted ham radio for religion.

Why don't you go post this crap on alt.religious.fanatic. The last time you primitive's had a cause was during the switch from AM to SSB. Ham radio will move forward in spite of these self-righteous fools.

Amateur Radio Operators
From the State of Michigan

We the Amateur Radio operators from the State of Michigan do hereby agree to continue to abide by all the rules of Amateur Radio. We pledge to improve the amateur radio bands, and teach new hams joining the hobby the correct operating procedures which should be followed on the amateur bands. By doing this, we are petitioning the American Radio Relay League in our fight to help clean up the language on the Amateur bands, and are looking for civility/politeness in conversations. By showing our support in this petition, we are hoping that the American Radio Relay League can help us fight the language that we are hearing on these bands.

We are asking the American Radio Relay League to help in this clean up by: Hosting several national forums on this problem, and how it can be addressed, We are looking for a promise from the ARRL to report on how enforcement is currently done. We are also looking for a promise from the ARRL to create a sort of self enforcement mechanism, and possibly create a large fine mechanism that will generate enough money to help correct this problem. We realize there is such a thing as freedom of speech but, there are also the words such as civility, and politeness.

I Deborah K. Kirkbride KA8YKK am asking all amateurs in the State of Michigan to please sign this petition, and send it to me at the following address: 1315 Center Avenue, Apartment #1 Bay City, MI 48708. I will in turn when enough signatures are gathered be sending all petitions received to the ARRL.

Please make copies of this petition and pass it along to other clubs, and Amateurs in you area. Please help me in this fight to get the Amateur Bands back on the right track and keep them there.

If you are not from the State of Michigan please feel free to download this off my web page http://www.concentric.net/~ka8ykk change the state name to fit your own and get this started in your own state. You can forward them to me and I would be more than happy to submit them to the ARRL with the State of Michigan.

Thanks
Debbie Kirkbride KA8YKK

Hi Larry, there's one in the SuperMorse manual that uses an opto-isolator.
If you already have your computer ground and transceiver ground the same,
for a lot of transceivers, all you need is a transistor with a 20k ohm
resistor in series with the base and the emitter grounded. Let's see if
I can do it in ASCII.

```
|-------collector to key input---->>
RS232-------/\/\/\/\/--+----| 2N2222
20k | |--emitter----+
| |
| | /| |
+---|< |---anode---+---to ground------->>
| \|
diode
```

This works on my ICOM-745.

>Anybody tried to run IPv6 over AX.25?
>Is it likely to be better than IPv4 over AX.25

It is likely to be worse. Longer headers mean more overhead, i.e.
a larger percentage of the 256-byte packet will be spent on headers
than with IPv4.

We have a very large addressing space available for amateur packet
radio, and I think at least that will be no reason for migration to
IPv6 anytime soon.
(e.g.: about 3% of the space assigned to the Netherlands is currently
allocated)

Hmmmm, one who speaks without thought. Or knowledge as far as that goes. Perhaps he knows not of the STA to get 900 MHz spread spectrum packet networks running. A fine TAPR thing that is in progress right now. I have yet to see any campaigning to get the use of the internet involved as the sole method of traffic movement for packet networks.

I would say that one who speaks like that above should first get to know first hand as to what is happening in packet radio and who is doing what. In fact I would ask that person just what are they doing to improve packet radio and radio link speeds. Besides of course just spreading rumors and complaining about the sorry state of affairs.

And yes, I am a member of TAPR and proud of the fact, and also proud to be part of the STA to improve Spread Spectrum high speed links for amateur radio. Links that are designed to not need phone lines.

WE NEED the 3.1 version. I know a lot of guys who use there old computer for digital stuff and rig control etc. They keep the Pentium 266 for internet and stuff that really needs the speed. Thanks for asking. Chris N7ZW.

Anybody tried to run IPv6 over AX.25?
Is it likely to be better than IPv4 over AX.25

I am planning such a setup, any any thoughts will be
appreciated.

It is likely that most applications for IPv6 over lower speed (at least below
28.8kbps) links, and where packet size is small, will use some form of header compression.

For a more complete discussion of header compression consult:

ftp://ds.internic.net/internet-drafts/draft-degermark-ipv6-hc-02.txt

As with most of these schemes, the IP, UDP and/or TCP headers can all
be compressed. This work mostly was focued on point-point links (but
they discuss extensions for broadcast media).

I won't claim to understand all the issues yet (as I am new to packet radio), but there are
a few complexities here:

IPv6 requires every link have an MTU of 576 bytes or greater. Some
form of link fragmentation is required if not. Note that this is not
a requirement that an app use segments of this size, it merely says
that the link must support it if the app decides to. Does the
IP-over-AX.25 allow for link fragmentation? (BTW, where is
this encapsulation defined? I couldn't find an RFC, and none
of the web links I ran across pointed me to the spec) A new
encap would probably need to be defined. (Is anyone doing
this? Has anyone looked in to using either 802-style or PPP-style
encapsulations instead?)

Radio links can be lossy, header compression requires keeping
some state that might get out of sync if packets are lost. One
would need to know the loss characteristics of a band to pick
the right amelorating mechanism I would suppose?

Where do you implement it? If you stack is all in software, then
just above the MAC driver (a shim above the AX.25 NIS driver?)?

Now as to why one would do this? I'm not completely sure myself. Many of
the ususal reasons given in the trade-press (e.g. mobile IP, autoconfigruation,
QoS) all have servicable variations that work in the IPv4 environment.
Given the current state of IPv6 deployment, you would just be talking
to a small number of experimentors or running via a gateway.

IMHO one's time would be better spent getting good v4 Mobile IP and autoconfig out to the packet radio community than getting IPv6 going. (Are there any mail/news lists where Mobile IP and autoconfig are being discussed?)

Don Hoffman (No call yet. Taking test this weekend.)

Cheap skate eh? We are of the same cloth. Didn't know if you wanted to
get in the packet "area" or if you needed exactly 5.12 but, Mouser has
microprocessor xtals for about $1.25 ea. in the following:

5.068
5.185

Or of course JAN for about $15.

There is of course no reason to stick to 256 octets/packet (except if
you're still stuck at 1200bps).

Actually, a transition to IPv6 has been discussed on TCP-group,
but I guess there is a wait-and-see attitude.

>We have a very large addressing space available for amateur packet
>radio, and I think at least that will be no reason for migration to
>IPv6 anytime soon.
>(e.g.: about 3% of the space assigned to the Netherlands is currently

Hm, there is: larger frames at a given bit error rate increase the probability of a frame beeing hit by a bit error. Thus, link quality degrades with larger frames.

There are still reasons. Depending on the distribution/correleation of
bit errors, you might get lower packet loss rate at even the higher
speed by using smaller packet sizes.

Also, latency sensitive applications such as packet audio or video
benefit from small packet sizes up to 19.2kbps rates. It was this application
that drove most of the recent interest in the Internet community
in header compression.

The DSP-12 is a multimode communications controller that was
built by the L.L. Grace Co. It uses both standard and DSP processors.
They no longer manufacture it.

I have one, but haven't really done a lot with it.

Yes, in a general sense that is true, but depending on the error statistics (distribution, etc.) and other factors there will be an optimum packet size in terms of throughput ... IOW, the probability of bit error and the probability of packet error are not necessarily "linear" ... this may be particularly true when the error statistics are "bursty" as may well be the case when you're "interference-limited" rather than limited by AWGN-like channel noise ...

Hi everyone:

For those who don't already know, I am VERY interested in APRS, but don't have the equipment to get on the air with. As a result, I am in the hunt for ANYONE who has a used (or bought but never used) MFJ-8621 Data Radio (This is the APRS equivelant to the MFJ Data Radio used by many packeteers on 145.01 Mhz.).

Anyone who's SERIOUSLY interested in making me an offer, email me PRIVATELY so we may discuss terms without causing undue harm to the SIG or bogging down traffic on the newsgroups.

73's for now my friends!! :-)

You first need to define how to encapsulate IPv6 datagrams in
AX.25 packets. There is such a definition for IPv4 datagrams but
IPv6 would, of course need another.

You can, of course tunnel IPv6 datagrams in IPv4 datagrams but that
is really a little silly :)

It's not worth it on packet really, apart from the fun of it :)

I use windows for workgroups 3.11 on a new pentium. I have Win95 on a
laptop. Most of the time when I am in the shack I use 3.11.

Compiles and works rather well, and there is also a basic version for an
8086 that also works if you lack a compiler.
The naming convention is described in the documentation for jnos.

Sure, but in my experience - the link margin and channel quality is
usually good enough for putting through larger frames when
other modulation techniques than AFSK are used. I'm not
saying that 1200bps = AFSK, but in most cases there is..

As I have experienced, there is a lower bit error rate using
19.200bps with 512 octets/frame on an FSK link, than with
the "normal" 1200bps AFSK setup.

...and that is what I was referring to.

Win 3.1 still works for me on my 486 66mz. I don't have a reason to
change untill, of course, software for 3.1 is no longer written.

Longer latency can be a problem in interactive applications.

>
>Hm, there is: larger frames at a given bit error rate increase the

IP frames have sufficient error detection capability when used on
quite reliable LAN and fixed line links, but using it on the
unreliable and unpredictable radio path is just begging for trouble.
Even when transferring IP frames over the telephone network a much
more robust coding is used between the modems. The worse the network
turn around time is (especially half-duplex or simplex links), the
larger the frames are, the worse is the penalty for a single bit error
due to the retransmission delays. In such a situation, including some
form of forward error correction will improve your total throughput if
you are suffering from random errors and interleaving can handle short
burst errors but does not help with collisions (but that is an other
problem).

I posted a message already on this thread, but let me post what I just wrote in the last TAPR PSR (Packet Status Register). I think it answers a lot of what is posted on the amateur packet radio network. However, if change is bad, then I am guilty.

By the way -- TAPR is more active now as an organization, with on-going projects and active member participation, than at any other time in its history.

President's Corner, PSR #66, May 1997
(c) 1997 TAPR

What will Amateur Radio Networks look like in the future? or will amateur radio digital networks look any different in two years then they did 10 years ago ?

The past ?

Let us look back at how we began in the early 1980's with this thing called packet radio. We (amateur radio) began by building units capable

of talking to each other in a local environment. It was a thrill to be able to talk to someone across town or within the county. Not until later in the process did we have any kind of long-distance networking. Networks like NetRom, ROSE, KaNodes, TexNet, etc came on the scene to provide linking to get us from point A to point B over RF over several miles or hundreds of miles. These systems did not appear until after 1984, over 5 years after the first TNCs were available. This entire trend of networking was driven by the interest within the community to build such networks and the growth of the user base who owned TNCs. As we had more people owning a common data communications interface, we had just enough critical mass to make networks happen and to keep them going and growing. Some of these networks have been operating over 10 years, which is a real accomplishment considering the volunteer nature of a few people behind the process for each network. Much of this interest and growth was because it was a new and exciting technology for amateur radio operators to be involved in.

Interest and excitement -- that is what this is all about!

As technology has remained the same (for the most part), have we not seen a general lowering of interest within the packet using community as a whole ? There are exceptions to the interest and excitement indicators -- look at APRS or continued experimental development. Resources (money/equipment) are still hung at speeds that were available in 1985, while personal interest has moved in favor of a much different type of access which is focused on speed, bandwidth, and information access and availability. Let's face it -- technology has passed us by if we say 1200 baud AFSK or 9600 baud FSK communications are the best we can do as amateur radio hobbyist. It is time to make the jump to a new technology base.

I have recently been accused of being a 'moron' or the 'evil end of amateur radio as a whole' for stressing the importance of taking a step forward with new technology, but taking a step backwards at the same time because of the need to focus on local access issues.

This is where we need to move back to now. The emphasis has to be back on creating new technology to serve the general community for local access. The reason long distance networks were created was to connect these dispersed local areas together, but this process took time -- years in fact -- and new technology was created to make it happen. However, this new technology was a result of the user interface as it was designed. There is the problem. No new user interface was really ever brought forward past the TNC-2 that was so widely adopted. There are several reasons for this, but I believe the main one was price. TAPR did too good a job on the TNC-2. The cost was so low after the first 4 years, that most amateurs just didn't want to pay any more money to do better. There was also no incentive for doing it, since if you made the technology jump, there was typically no one else to talk to and getting a group to do something together was difficult, if not impossible.

We are now looking at developing new communication systems with physical limitation different from the past era of technology that will act as a current nodal point in communications. The systems that are being developed are a jump ahead in access and usage. Why hamper them with the requirements to work with systems that were based on 1970's technology? We shouldn't.

We have to start from the beginning. Build new local access infrastructures and then begin to explore ways of intercommunications based on the tradition of amateur radio ingenuity and availability. We cannot expect much of the technology currently installed to support the speeds of access for enabling long distance communications that these new technology implementations represent. The only thing that does remain viable in many of the networks today are the sites, the sites, and the sites. Sites are one of the most valuable resources we have today and they get used with any new technology that comes along.

For the many who 'rant and rave' concerning what I am saying in this column (the possible abandonment of long distance 1200 and 9600 baud systems), they have missed a major point -- these systems have already collapsed in many parts of the US. While some are still functioning, this is because of a few dedicated volunteers maintaining them. However, without a new technology influx to stir activity once again and keep the interest of current and future participants -- total collapse and stagnation is very apparent in the future of our aspect of the hobby and possibly the hobby as a whole.

We seem to have basic choices to make. Do we remain the same, using and supporting current technology with limited people to do this or use our talent and resources to push forward into the future and develop new systems and operating benefits. There is some overlap in both, but trying to do both will limit our resources for accomplishing our goals and later implementing them in any wide scale solution that really move the hobby forward.

<snip -- the rest of the Organizational News you can read on the web page>

Cheers - Greg Jones, WD5IVD
President, TAPR

Yes, the knee of the curve will be different for different modulation
schemes, but within a scheme/band the rule would still hold.

This raises a question in my mind... Has anyone looked at the
error characteristics for the amateur modulation schemes in the
various bands? Some references would be welcome.

>amateur radio, there are much easier ways to do it.

Not amateur radio, the packet network. From where I sit, packet is on
its last legs. We had a much better network in 1990 than we have now,
even though our local net has been upgraded substantially, we can't
get any interest in the surrounding areas to restore and/or upgrade

links we've had in the past.

>Let me hit on a few points I have read in this thread.

This makes sense.

<remainder of message deleted for brevity>

>Cheers - Greg Jones, WD5IVD
>President TAPR

Thanks for posting this. I must ask why you or some other TAPR
representatives are not addressing the comments made on the packet net
by N5PVL (I believe it is) and others? The problem of BBSs moving
traffic on the phone rather than using existing RF ham links is a very
valid one, in my opinion.

Subject: baycom problem maybe with a 16550A Uart?

hello,

I'm using the 1K2 baycom serial modem with Linux 2.0.30 without
a problem on a 386DX40 with UART 8250.
A friend of mine has a P166 with UART 16550A and when he loads
the axattach utility the computer hangs completly!
It loads the baycom driver and it detects a 16550A.
Does the baycom driver really works with 16550A type UARTS ?

After a few frustrating tries i decided to upgrade to the latest AX25 utils
that I could get to work with my current kernel ( 2.0.30 ) , ie, the
AX25utils-2.0.12c, but with no luck :(

my rc.ax25 is like this. His own is only different on the bay0 IPADDRESS.

-------------------------------------------------------

#!/bin/sh

echo "Configurando modem Baycom para Packet Radio"
# Configuracao do modem Baycom na COM2

echo -e "Desactivacao da COM2:\c"
/bin/setserial /dev/cua1 uart none

echo -e "\nInstalacao do modulo em memoria:\c"
/sbin/insmod slhc >/dev/null 2>&1
/sbin/insmod slip >/dev/null 2>&1
/sbin/insmod baycom modem=1 iobase=0x2f8 irq=3 options=1

echo -e "\nAXattach e outros:\c"
/usr/local/ax25/ax25/axattach -i bay0 /dev/bc0 radio
sleep 2
/usr/local/ax25/ax25/kissparms -p radio -t 500

porto=`cat /proc/net/dev | tail -1 | cut -d":" -f 1 | grep "sl"`
if [ "${porto}" != "" ]
then
```

```
echo -e "ifconfig:\c"
/sbin/ifconfig ${porto} bay0 netmask 255.255.255.0 broadcast 10.0.2.255 up
echo -e "\nroute:\c"

Dear Dale and Glen.

Dale, I am surprised at your statement in the message posted to the list. As a former member of TAPR in 1995-96, I would have thought you would have seen the vision of where TAPR was heading with Spread Spectrum technology and the potential positive impact to digital communications it can have. I'll touch on some of these below. I do take exception that TAPR 'was' a great organization. Maybe you can elaborate on why you feel that TAPR is leading amateur radio to its 'slow death' ?

Glen, I can only assume as a BBS Sysop you have been reading the one sided trashing I take weekly from people on the packet radio network about how I am single handily wrecking amateur packet radio (although they don't mention it is with the help of people like Dewayne Hendricks, Phil Karn, Tom McDermott, Lyle Johnson, Barry McLarnon, Steve Bible, and many others that influence this aspect of the hobby year after year). You asked "If the stories I'm reading can be believed" -- well from my point of view, you shouldn't believe them. You should do a little research and find out what is happening within TAPR. Then make up your mind. The truth is probably someplace in between. If I wanted to wreck amateur radio, there are much easier ways to do it.

Let me hit on a few points I have read in this thread.

As to the statement about Spread Spectrum technology is out of the reach of amateurs -- the only thing stopping amateur radio from utilizing the benefits of Spread Spectrum communications is ourselves. There is nothing stopping amateur radio as a hobby from making radios that are magnitudes better then current Part 15 radios that cost a fraction of the cost. All except the rules. Technology and rules are what TAPR is working on. There is not enough room in this message to discuss the issues here, but I would refer anyone to read my President's columns since 1993 which are posted on the TAPR web site (http://www.tapr.org/tapr/html/psr.html). You can read in those columns the changes in TAPR during the past several years and the reasons for dedicating a lot of the organizations resources on this 'very old' mode. If we want to be able to have real performance (256Kbp and faster) that is plug-n-play (not like 9600 baud even with new commercial radios) then this is where we have to head. Making wider and wider narrow band radios hasn't worked for many reasons which are outside of this thread.

TAPR will not reach those goals without members and their support. In 1993, when I became President, TAPR was at its lowest membership since its formation -- less than 900 members. Today, we have around 2500, the highest ever seen by the group. That shows you at least the vision that the TAPR Board of Directors has set is being followed by someone out there. If Spread Spectrum was easy, everyone would be doing it. No difference in the TNC technology developed by those founders in Tucson in the early 1980's that you take for granted now. With luck, the amateur radio hobby will be taking for granted the enormous amount of time and technical expertise that volunteers within TAPR are contributing on the Spread Spectrum issue.

While TAPR might be focusing a good deal of its research and technological energy on Spread Spectrum, that doesn't mean that we have

abounded packet radio. We continue to support 9600 baud operations with the only bit-regen modem available and a team within TAPR is currently doing a design review on the TAPR 9600 baud modem to cost reduce it so that we can continue to support amateurs operating at 9600 baud for many years to come. Shortly, we will be publishing FREE on our web site the "9600 baud land mobile radio modifications book" that has been worked on for the last two years. It covers a bunch of commercial land mobile radios and we hope to add more to the electronic publications in the future.

Dale asks why TAPR hasn't pushed 9600 baud. A good many of us were operating 9600 baud starting back in 1984 and 1985. There is nothing magic to it ? TAPR introduced the first K9NG 9600 baud modem in 1983, TPRS (Texas Packet Radio Society) introduced a 9600 baud modem in 1985, and G3RUH had his out in 1987 (I might have missed those dates by a year or so -- off the top of my head). This mode is over ten years old and there are plenty of books, modems, radios, and other stuff just sitting around. The only thing stopping people operating it is that they choose not to. We can fill the bucket with water, but the horse will not drink unless it wants to. TAPR can provide technology and education, but the amateur radio operator out there has to want to do 9600 baud or other technologies. There has to be a spark of interest and dedication to get people motivated to do new things and spend their personal time doing them. Spread Spectrum digital communications (data, video, voice, and more) potentially holds that for a good many amateur radio operators.

You say packet radio is not the Internet. I can't agree more. It isn't, but why stop new technology development (i.e. Spread Spectrum), because an amateur radio operator will choose to use it for that ? That is at least the argument I fight many a time these days. A radio is a tool that we use to communicate with. People use CW, ATV, SSB, Packet, and many other modes. How someone chooses to implement the use of their radio is their choice and decision. As long as they are 1) learning something (education), 2) experimenting with something new, or 3) having fun -- then they fit into my world view of what amateur radio is all about. My goal within TAPR is to led a technology change that will allow amateur radio hobbyists to take advantage of technology that is not 30-50 years old, but just a few years and by doing this hopefully allow our hobby to stay on top of the technology curve instead of falling behind and being seen as a segment of the spectrum to be sold to a commercial service that might be able to do better then Part 97.

We must move back to our roots as experimenters and technicians. If we don't -- then amateur radio is in a lot of trouble 20 years from now. We don't all have to be experimenters, but we need more then we have today doing it. If experimentation is hampered by the concern that people must have perfect communication bands, then we will be operating narrow band FM and 1200 baud packet radio for a long time to come. People will continue to leave amateur radio for the Internet, PCS, Part 15, and other services because they are not locked into traditions that don't change for decades at a time in these other services.

Let me end by reprinting something I wrote in my President Corner in October 1995 in the TAPR PSR:

Why the sudden interest in Spread Spectrum you might ask ? Actually, amateur spread spectrum falls into a line of logic that TAPR has been chasing for three or four years now. In 1992, the (TAPR) board of directors stated that a primary long-term goal should be the development of higher-speed access for users. At the last two annual meetings we had late night skull sessions discussing how to get users to higher speeds using conventional narrow band systems. When all discussions were done -- two things were obvious with traditional thinking and technology. First, that those with technical ability had been doing faster speeds since the early 80's and second that typical amateur operators were not willing to pay above $500 to gain marginal increases in speed. At the 1995 (TAPR) annual meeting in St. Louis, MO, it was becoming obvious that the amateur community had to take advantage of the research and development money being spent on new wireless technologies. When you combine the newer RF devices being manufactured for part 15 devices and PCS applications, along with the continuing increases in computing power -- a simple answer appears: "We must exploit amateur spread spectrum technology in order to break out of the 1200 baud user mold!"

Cheers - Greg Jones, WD5IVD

just scrounged up a 7AH gell cell and wondering some ways
to charge it as I only have a 500ma adapter for charging. I
asume I need to just plug it in and periodically check the
voltage to prevent over charging?

Now for emergencies (was hoping to use it with ARES)...
If you can hook two car batterries together +_+ and -_-
can you do the same with gell cells? Read somewhere that
30 minutes with jumper cables would work!

What about pluging it into the cigarette lighter socket?
positive to positive again. The draw would only be 7A
right? So most car lighter sockets are good for 15A
and should not over heat? How long would this
take again?

2672. Re: Anyone Still Using Windows 3.1?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-22 00:00:00 UTC
From: David L Pearce <dlpearce@eos.ncsu.edu>
Message-ID: <3384772B.ED512818@eos.ncsu.edu>
Source record: 29932

I can almost guarantee any of the HAMS that are running Win 3.1, have a 386, though. If you compile your code for win32s and include the distribution of win32s with your program, maybe even integrate the installations, you could still extract 32bit performance under Win 3.1. Win 95 is nothing but Win 3.1, with a finalized win32 kernel component very similar to NT, and its definitely not as protective as NTs, as you can still execute evil instructions in 32bit mode that destabilize the whole OS . . .

2673. Convers-IRC gateway program (announce)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-22 00:00:00 UTC
From: dg1kjd@dg1kjd-svr.ampr.org
Message-ID: <338466cf.3094860@dg1kjd-svr.ampr.org>
Source record: 29933
Cross-posted to: rec.radio.amateur.digital.misc,ampr.de.tcpip.convers

Hi all,

some time ago I found it to be a good idea to write a program which
allows convers sysops to connect their network to an irc network in a
way which enables all users to talk to each other. This allows for the
following two optimizations:

1.) Easy and slow migration to the technically superficial IRC system

2.) Allows users to chat with convers users using a modern graphical
IRC client like mIrc, Zircon and so on. This means a great improvement
in chat convenience.

I called my program "ircgate" and the current version is 0.4b.
If you read this article on a BBS system you will also find another
article with a 7plus-encoded archive containing the package. If not,
you can get it by FTP from the following systems:

Home system, but only reachable from within amprnet:
ftp://dg1kjd-svr.ampr.org/pub/linux/irc/ircgate-0.4b.tar.gz

Backup 1,from outside amprnet:
ftp://db0bm.automation.fh-aachen.de/pub/incoming/ircgate/ircgate-0.4b.tar.gz

From inside amprnet:
ftp://db0bm.ampr.org/pub/incoming/ircgate/ircgate-0.4b.tar.gz

Backup 2:
ftp://ftp.ucsd.edu/hamradio/packet/tcpip/incoming/ircgate-0.4b.tar.gz

....

Hello,
I am using (and also do maintanance on some nodes, have built many of
hardware..) and it works. The result is, that 1/2 users of packet
radio users in s5 are using at least 38k4 user access with simple WBFM
radios. Most of them are built by the users themselves, and that's
what HAMRADIO should be, isn't it?
At the moment, there is at least 6 links in S5 on 1.2 Mbit (PSK radios
for 23 and 13cm) and we also already have users on 1.2MBit 23cm.
The main problem is - if you are used to 'normal' PR, that the network
in other parts of Europe is still at rates 9k6, somewhwre there are
few 19k2, but much more under those antique rates. I tried some
times to go through the network to reach for example northern part of
the Germany, but you get old before you reach it...
What's the reason? Did HAMs become lasy? Or the only way to
get a RIG is to go to the shop and simply buy it, and if the
far-east toys are not capable of handling more than 9k6, than stay
there....

There are a few '16550A compatible' buggy UARTs around. When
one changes the baudrate while something is transmitted, these
UARTs go nuts (read: they produce spurious interrupts). There isn't
a lot one can do against this: the driver relies on changing
the baudrate to recover the RX clock.

You might apply ax25-module-12 patch
(from ftp://ftp.pspt.fi/pub/ham/linux/ax25). I've changed
a few bits there (besides the driver being a 'real' ax.25 network
interface with the patch), which fixed similar problems
(I got 1 positive report and 0 negative :-))

Since I don't have these problems myself, they're difficult
to fix for me... my two 16550A work flawlessly :)

Can you tell me the manufacturer and part number of your
multi IO chip?

2680. FS: Kantronics Dataengine, Two 9600 ports

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-23 00:00:00 UTC
From: david@stat.com
Message-ID: <5m48fh$m70$2@nnrp1.crl.com>
Source record: 29940

For Sale: Kantronics Dataengine, with Two 9600/19.2k modems installed.

Asking $275.

Thanks, David

Why does every one pick on the phone section of 75 to make their point.
If you knew CW and listened on from 3.5 - 3.7 you would find a

completely different attitude. It's why I like CW.

No, this is not true. HAMRADIO is also about using the latest technology. Using WBFM on 70cm is not what I consider the best possible solution. The transceivers you are refering to need at least 200kHz of valuable bandwith.
Here in Germany we try to setup some 200kHz wide user access points (76k8 FSK). The transceivers are already developed but what is missing is the permission to use them. Currently there are some ATV guys who think that AM-ATV is still state of the art :-(So it may be a problem to get 2 200kHz wide channels (for duplex) on our 70cm band here (remember: we only have 430-440MHz).

> 73, Pavle, s57ra
>

Same problem on 23cm. We have 2 segments for packet radio - each 2 MHz wide at the corner of the 23cm band. 2 MHz is not enough for a single 1.2MBit BPSK signal! And what we want (and what we actually achieved here in Germany) is a *network*, so we really need more than 1 channel :-(Given the 50kHz wide channels 19k2 is not too bad. Using 4FSK 38k4 should be possible. Of course we want and we need higher data rates for our interlinks and our access points. But with our frequency allocation

scheme here this is possible only on 6cm or 3cm. 13cm may be used in some areas (we have a special license for 13cm), but may be a problem where 13cm is used by the primary user of this band (amateur radio service may not cause interference).

To put it into a nutshell: give us bandwidth and we provide you with a network like the on you have in S5. It is not a technical problem it is more or less a "political" one. The HAMs here are not lazy and 99% of the equipment used in the digipeaters is homemade (mainly RMNC hardware and "Interlink" TRX I und III for FSK on 23cm).

73' Alexander

Hi ..!
Would like to get in contact with anyone having success i-facing
FT 736 and the ALEFN DSP-4 card with G3RUH modem s/w.
Am using same set-up as with my (former) DSP12, but no joy so far
with DSP-4.
This card runs ok with software modems BPSK1200 and FSK1200, the
latter sharing same disc. connections to FT736 as the G3RUH modem.

Huh? It was dedicated volunteers who started them in the first place.
I don't see your point here.

>without a new technology influx to stir activity once again and keep the
>interest of current and future participants -- total collapse and
>stagnation is very apparent in the future of our aspect of the hobby and
>possibly the hobby as a whole.

This paragraph misses the whole point. Packet networks have
collapsed, not because of inherent flaws in technology, but because of
apathy and lack of cooperation among hams. New technology may cause a
burst of new activity, but once the novelty has worn off and the grunt
work of building, maintaining, and improving a realistic network
begins, we'll just go through the whole process again. We need new
technology, but we also need to address the "people" issues involved
in packet, which is unique among ham radio sub-hobbies in that it

requires cooperation and trust among hams in order to work. This chain is only as strong as its weakest link, unlike almost any other activity in ham radio.

<remainder snipped>

>Cheers - Greg Jones, WD5IVD
>President, TAPR

This was all very interesting, but it does NOT address the issue I raised in my original post. I still have a few questions.

- Why do I not see the TAPR side of this controversy in *packet radio* bulletins?

- Is there any truth to the many accusations that TAPR is promoting use of the Internet as a linking method, to the detriment of the existing ham RF links?

- Why has Hank Oredson W0RLI been banned from TAPR discussion groups?

I.I.A. Italian Islands Award

*** IIA TROPHY - 1997 ***

This Trophy is issued by the Crazy DX Group.
Every OM and SWL (world-wide) can participate.
The purpose is to contact/listen/activate the largest number of different
italian islands.
Only referenced islands from the official IIA list will be valid, but also
any possible island reference released after the Trophy's starting.
The participation is free of cost.
Have a good hunting !

PARTICIPATION PERIOD

From June 1st to September 30th 1997.

BANDS

It will be valid every qso/listening/activity on every amateur radio band.

POINTS

Each different contacted/listened/activated italian island will count 1
point.

CATEGORIES AND PRIZES
---
3 categories are available: OM, SWL and DX-PEDITIONERS.
It's possible to participate at more than 1 category. Points of different
categories cannot be combinable.
In the DX-PEDITIONERS category, it's necessary for the participant to be
the
owner of the used call-sign in every activity.
A plaque will be awarded to the top scoring participants in each category.
Complete results will be sent by the postal service to every participant.

LOGS

Complete logs with datas of every qso/listening (call-sign, date, UTC time,
band, mode, IIA reference, correspondent call-sign for SWL category) should
be sent within November 30th 1997 to the following address:

CRAZY DX GROUP - P.O. BOX 11 - 04011 APRILIA - ITALY
or through e-mail: crazy@grisnet.it

For DX-PEDITIONERS category's participants, it will be enough to send the complete activities list (dates, used call-signs and IIA references).

SPECIAL PRIZE FOR THE CRAZY DX GROUP MEMBERS

A special prize will be awarded to the Crazy DX Group member that will achieve the best result.

CRAZY DX GROUP
P.O. BOX 11
04011 Aprilia (LT) - ITALY

I.I.A. Italian Islands Award

-- TROFEO IIA 1997 --

Il Trofeo, istituito dal Crazy DX Group, e' aperto a tutti gli OM ed SWL italiani e stranieri.
Scopo della competizione e' di collegare/ascoltare/attivare il maggior numero
di isole italiane diverse.
Fara' testo la lista ufficiale IIA. Saranno valide anche eventuali referenze
assegnate dopo l'inizio del trofeo. La partecipazione e' gratuita.
Buona caccia !!

PERIODO DI PARTECIPAZIONE

Dal 1 Giugno al 30 Settembre 1997.

BANDE

Sono validi i qso/ascolti/attivazioni su tutte le bande radioamatoriali.

PUNTEGGIO

Ogni diversa isola italiana collegata/ascoltata/attivata varra' un punto.

CATEGORIE E PREMI

Sono disponibili 3 categorie di partecipazione: OM, SWL e ATTIVATORI.
E' possibile partecipare anche a piu' di una categoria. Non sono cumulabili i
punteggi delle diverse categorie.
Per la categoria ATTIVATORI e' necessario che il partecipante sia il titolare
del nominativo usato in ogni attivazione.

Saranno premiati con una targa i primi classificati di ogni categoria.
I risultati e le classifiche saranno comunicati per posta a tutti i
partecipanti.

ESTRATTI LOG

Gli estratti log completi dei dati di tutti i qso/ascolti (nominativo,
data,
ora UTC, banda, modo, referenza IIA, nominativo del corrispondente per gli
SWL) dovranno essere inviati entro il 30 Novembre 1997 al seguente
indirizzo:

CRAZY DX GROUP - P.O. BOX 11 - 04011 APRILIA
oppure via e-mail a: crazy@grisnet.it
o via packet a: IK0QDB@IW0FEF.ILAZ.ITA.EU (bbs) o IK0QDB >I0OWK-6
(pcl)

Per i partecipanti alla categoria ATTIVATORI, sara' sufficiente inviare la
lista delle attivazioni completa di date, nominativo usato e referenze IIA.

PREMIO SPECIALE PER I SOCI DEL CRAZY DX GROUP

Un premio speciale verra' assegnato al socio del Crazy DX Group che avra'
conseguito il risultato migliore.

>in UseNet?

I am glad I had time to get on here and respond. I try not to most of the time, because if I am on here answering then other TAPR members will not. This then leaves me more work to do. I saw that Fred in Ohio and others had responded back and I expect TAPR members to take the led on issues like this. If one person tries to do it all -- me -- then TAPR and myself personally don't get anything done. Members in TAPR have to support TAPR by getting on packet radio and this usenet group and providing information and defending what they believe amateur radio is about. From the various posts I read, I see a lot of support for TAPR on here with help, pointers to the ftp site, and just general information. It is always pleasent to see someone listing TAPR membership or the TAPR web page in their signature.

As to presenting TAPR's case on packet radio -- Who knows. I haven't used a BBS since I moved to Austin in 1992. The problem I had when I stopped was that people would send me TAPR related business messages over packet radio -- so my solution was to stop using packet radio e-mail. The down side to being President. While there is nothing in the rules against this since I don't get paid as President and TAPR is a non-profit group, I personally don't think that it is a good thing. SO, I am no longer reading packet radio BBSs for e-mail. Also, spending hours accessing the local BBS is not what I do in amateur radio these days. I did it for a long time years ago, but not now. Just like I did CW traffic handling for a long time, I moved on to new things. As to trying to respond back to these critics, I choose to have my actions in implementation and project management answer them. You don't see me posting on here very much or the packet network, because I am working on changing things and that takes a lot more time then posting messages all the time. I would have to decide to do one or the other not both -- and personally I feel I have more influence in working on projects and getting things done then spending the 120+ minutes writing this response as an example. That two hours I could be spending redoing the APRS MicEncoder manual, or building that DAS kit I need for controlling a

radio at a remote site, or working with Dewayne on the TAPR reply comments to Docket 97-12, or any of the long list of things on my TO DO list.

Maybe you would like to volunteer as TAPR Packet Radio Liasion ? We had someone posting stuff to Packet radio and feeding stuff back that they thought should be seen, but that volunteers has stopped. TAPR is only as strong as it volunter members, so if you see something not being done -- time to volunteer your time and take an active part in changing things.

>>point of view, you shouldn't believe them. You should do a little
>>research and find out what is happening within TAPR. Then make up your
>>mind. The truth is probably someplace in between. If I wanted to wreck
>>amateur radio, there are much easier ways to do it.
>

>even though our local net has been upgraded substantially, we can't
>get any interest in the surrounding areas to restore and/or upgrade
>links we've had in the past.

I can't disagree more. All depends on where you are. Some networks are better now then they where in 1990. Your network - in your part of the world, might be worse off, but not everyone is in this boat. VHF/UHF packet radio is different in every 50-60 mile radius, or there abouts. Then again, what do you mean by 'packet radio' ? If you mean just networking and BBSs -- could be. Nothing has changed since 1985 -- which was the point of the article I posted. The areas that have new life are the new technology aspects -- APRS and others. Networks and BBS operators represented the 1% of the packet community. 1% is not very many to support systems that a mass of the population don't use anymore, because things didn't change for the better -- but stayed the same.

If packet radio is on its last leg -- so be it. Selection of the fittest. If packet radio isn't fun for people they are going to find something else to do. This is a hobby not a job for most. I get paid to maintain commercial stuff -- I even work on it when it is not fun but the motivation is different.

One thing that Charles and others have never understood is there is nothing stopping amateur radio from building the national network they want, other then the cost, people power, and that with the technology they want to implement it with it will never work well enough to get from point East to point West. Just read the paper that Tom McDermott, N5EG, published in the 13th ARRL Digital Communication Conference. http://www.tapr.org/dcc

A Primer on Reliability as Applied to Amateur Radio Packet Networks by T.C. McDermott, N5EG Scope: Many messages have been sent regarding linking of large number of packet radio switches, nodes, digipeaters, etc. And some have commented on the desirability of very long packet networks. This monograph will describe how to calculate the availability

of such a system, given knowledge of the performance of the equipment.

Tom's paper shows that you can't manage a network after a certain size based on the technology that is implemented by AX.25 packet radio as many use today. The solution is that you have to have long-haul distance connections. Now Hank will say that HF then should be used. However, HF is not fast enough to support what people want to do today -- it was in 1984 when we had a fraction of the users that where happy at just sending private e-mail messages. We have to develop gateways and bridges to do this that use new technology then old and tried methods. These will someday be balloons at 21Km (see Sky Station -- maybe we can get a amateur radio payload on board one day) ? AMSAT satellites ? The Internet ? HF links that go 9600bps or faster, and other over the horizon technology that hasn't filtered down yet into amateur radio technology channels.

Regional/local groups have to decide personally how they want to connect to other digital groups in amateur radio that are not in their local area. Until we can support long distance high-speed long-distance networking -- which I talked about in the article I posted -- many will use the Internet because 1) it is available, 2) easy to setup since finding sites is sometime impossible these days to build long-haul networks on or people don't want to do it because it is REAL work and not fun, and 3) they are interested in playing with it. Just like packet radio combined radios and computers, why should we be surprised that amateurs want to somehow combine their current interest in the Internet with amateur radio. Amateur radio is about inclusion. Many who yell loudest about the end of amateur radio or all about exclusion, not inclusion. If we exclude everyone that doesn't believe amateur radio works the way we do -- that will be the true end of amateur radio.

We must embrace the way people want to operate, understand it and communicate how we personally do things. I might disagree with how you chose to operate -- but it is your right. That is the greatest thing about amateur radio. If I have a concern, then I have the right to talk about it, but I don't have the right to insult, badger, and degrade others that don't agree with the way I see the world. I find it **offensive** when people who disagree with the selection of operations another amateur operator has made gets blasted with insulted on the issue for just having a different viewpoint about what amateur radio is to them.

Lucky for us that these folks are in a vocal minority. Just because they post a lot, doesn't mean they represent any large core element within amateur radio. I believe that most amateurs just want to have fun and share their interest in radio communications with others. Most don't want to get involved in personal debates like the one happening here. They just want to have fun and learn new things. This is only a hobby -- for most folks ;-)

Wrong implementation design. This is like asking let's try to use a
telephone modem over amateur radio. Good thought, but the design outcome
are different to a large extent. For these things to work correctly and
not interfere with others they have to be designed that way. The
positive news is that we can use the same hardware that are in these
phones and other SS devices for amateur radio designs. As I stated in
the article, amateur radio just needs to leverage off the millions major
companies are spending to our own stuff.

By the way, most cordless phones under Part 15 are not very good friendly
users on the band. One the of the problems we have trying to talk about
Spread Spectrum is that people aginst this technology point to some of
the poorest commercial implementations and say that is how amateurs will
implement it.

See above. I have know Charles a long time. Charles uses the TexNet
node I installed in Denton, Texas in 1986 and uses networks in Texas I
helped maintain for over 8 years. I have tried to hold rationale
conversations over e-mail and some of the TAPR SIGs with Charles and it
doesn't work. I gave up. I told Charles I would be glad to debate him

in a public forum such as HamCom in Arlington, Texas, Dayton HamVention or any other amateur gathering I have some influence on getting the speakers schedule set for the digital activities. Trying to debate with someone over e-mail or even packet radio that can post 10 messages to each well thought out comment I take a long time to write doesn't add up. You get drowned out after a while and just stop. Charles and others can win the debate by just out shouting everyone else. This was one reason the TAPR NET and BBS SIGs chairs asked the TAPR System Mgmnt Committee after two years of asking for calm on the lists to just lock him out. If you want to see a good example of one-sided dialog by Charles, you should subscribe to the TCP- GROUP that Brian Kantor maintains. Since Charles can't post his messages on the TAPR lists he has just moved over to the TCP-GROUP and continues. Some very well presented four letter words being used in replies to others in that group. Someone asked the same question on BBS SIG about the lockout a few weeks ago. I kept a running count -- the group was 3 to 1 in favor of the decision. The group was just tired of the diatribe and flaming after two years.

As I stated, I believe that actions speak louder then words. In ten years, I want to be able to look back and see the work that TAPR is doing now has significantly contributing to the furtherment of amateur radio as a hobby. The projects we having going on right now are a very good start and with luck when I leave TAPR someone will replace me that can supply as much energy as I was able to provide and continue forward. No other amateur radio volunteer group in the world that is TAPR's size has ever come close to the output of different new kits, publications, and technology each and every year. TAPR has had a major kit or publication (some times two or three) each year since it was founded. This with a number of different Presidents and Board of Directors, but the focus on doing was always maintained. Being President of TAPR is a unique position that I am very proud to have the opportunity to do. One of these days, I'll finally graduate and have to get a real job and will most likely look back at these days in TAPR with fond remembrance.

Can't spend much more time on this thread. Takes me a long time to write these messages and I am buried in school work and TAPR management issues. School is suppose to take 40+ hours a week for my PhD and somehow I seem to fit the 60 or so hours a week for TAPR stuff in there someplace.

Cheers - Greg, WD5IVD
President, TAPR

if average speed in this country had been 300bauds on simplex, it would
have made a very very great improvements.
Everybody talks about 9k6, but still they cannot build proper 1200baud
links. parallell HF links are often much better!
this is the situation in Norway - and large part of sweden(?) - 10 years
after.....
Packet mailboxes have most junk messages, only future for packet is for
dxcluster networks

Have you checked to see if you have your terminal program set to software handshaking ? As far as a hard reset goes thats very simple to perform.You will need to take the front and rear pannels off and remove the screw on the front of the case that holds the voltage regulator then remove the pc board disconect the battery for about a minute and then reinstall the battery and the pcboard and the screws and covers and your ready to put your call back in with the MYcall command followed by a space and your callsign and your ready to go.Good luck and best 73's de WB0K , John

Header compression needs a link that is relatively error-free, or else
it needs an underlying protocol that makes the link error-free. IPv4
is mostly run over AX.25 UI frames, you would need an AX.25 connection
to transport header-compressed packets. This would be possible with IPv4
as well.
However, the loss of going to a VC is probably more than the gain of header
compression in IPv4, especially on network links where traffic from many
stations is interleaved and header compression is not so effective anyway.
I have not seen anyone doing it.

> IPv6 requires every link have an MTU of 576 bytes or greater. Some

> this? Has anyone looked in to using either 802-style or PPP-style
> encapsulations instead?)

Fragmentation at the AX.25 link level is already done. There has been an
old standard that used 2 bits from the PID field to indicate first/middle/last
fragments, but it has never caught on and has been ruled out now because
PIDs were taken/assigned that don't have the top 2 bits set.

A newer scheme uses PID value 08, followed by a "number of remaining segments"
byte. The original PID is just sent as data.

> Radio links can be lossy, header compression requires keeping
> some state that might get out of sync if packets are lost. One
> would need to know the loss characteristics of a band to pick
> the right amelorating mechanism I would suppose?

Yes. And also, header compression more or less assumes a single-session
use of the link.

Steve,

Cecil is correct - I have seen that fast fourier transform FFT program also. Why don't you try HamCom. Terry Mayhan is the Hamcom guru in this country (tmayhan@accessone.com). Hamcom is a downloadable shareware program with a nice 12 - 15 part interface. All parts can be bought at Radio Shack, Dick Smith, etc. type vendors for less than 7 pounds.

Larry,

Try HAMCOMM. Do a search for it off the WWW. The lastest software is 3.1 - it's shareware. The instructions have a really simple 12-15 part (a la Radio Shack - not exotic parts) schematic. It does CW/ASCII/RTTY/& some versions of AMTOR. Terry Mayhan (tmayhan@accessone.com) to the USA guru of HamComm.

2705. What's Really wrong with Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-24 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.com>
Message-ID: <01bc6894$59e10960$2d7141ce@n5pvl>
Source record: 29965

Gents, ect:

The malaise which has affected Amateur Packet Radio over the last few years has manifested itself in several ways. One glaringly obvious problem shows, in that "running down" our current network in public has become so popular and acceptable in recent years among the "movers and shakers" of Amateur Packet Radio networking.
First the advocates of high-speed, then the devotees of amateur TCP/IP have lined up to sing an unbroken chorus of whining, complaining negativism, all aimed at the Amateur Packet Radio network and it's users. This has been going on for several years now. You don't have to be a motivational phychologist to know that when people hear their own "leaders" regularly disparaging and denigrating their efforts, they will tend to lose interest and lose heart. Sure enough, the quality of our "leadership" has fallen somewhat, and the packet radio community in the U.S. suffers to this day.

The depth of this malaise can also be seen in the pathetic, desperate attempt among amateur TCP/IP devotees to legitimize "radioless ham radio".

These people have discovered that TCP/IP can't hack it as an Amateur Radio networking application, but they will not let it die a natural, honorable death.. In fact, they are perfectly willing to use the telephone (Internet) for the bulk of their communications and PRETEND it's amateur radio, just so long as they can go on using "amateur TCP/IP"...
Weird, pathetic, and twisted, but true! "Radioless Ham Radio"!?! ;-)

It gets worse...

A sub-clique of these same "hams" are deliberately using Packet/Internet gateways to move Amateur Packet Radio traffic over the Internet instead of over ham radio links. This practice of "Internet Forwarding" serves to "route around" and replace the radio links of our digital network's "backbone" with telephone links needed and wanted only by amateur TCP/IP. The stupid thing about this is that given that these "hams" MUST use the telephone for their "networking system", there still is no rational justification for their vandalism of the existing Amateur Packet Radio network in order to do so.

It's not like Amateur Packet Radio would compete with them for telephone access... No, the competition they REALLY fear is in simple legitimacy. The amateur TCP/IP "amateur telephone" network will never be impressive to hams as long as there is a genuine RADIO-based, global digital network to compare it to. Even LandLine Lids realize that "My telephone is faster than your radio" is not an impressive bragging point among hams. Compared to a real amateur radio network such as we still have, amateur TCP/IP with it's utter, abject dependence upon the telephone is laughable. It's supporters

are painfully aware of this fact. -- And what is their reaction to this?

These people (I won't call them hams again, to avoid confusion) intend to see to it that the existing independent amateur radio network is undercut and dismantled, so forcing hams into an utter dependence upon the telephone and amateur TCP/IP. They are quite aware that hams would NEVER voluntarily do any of these things, so they attempt to FORCE us by working to destroy the packet radio network we have built. They attempt to destroy it from within.

Amateur TCP/IP devotees constantly run down the packet radio net, say the BBS forwarding network is no good and that the average packet user is a dope.
Then, these same people insist on being a "part" of that same BBS forwarding
network.?.!.? Then, it turns out that their "amateur TCP/IP BBS" stations use telephone links instead of radios, which cause existing ham radio links to die off while ensuring that new radio links do not come online...

Get it?

Their goal is to eventually leave packet ops NO alternative to amateur TCP/IP
and "radioless ham radio", and this represents the first really serious attack upon Amateur Packet Radio in it's short but impressive history.

If you examine the rhetoric of "Internet Forwarders", you will hear many references to "advanced technology", and the "new links" they provide..
To understand where they are coming from, simply replace those phrases with "the telephone"... This is no exaggeration!

That's ALL amateur TCP/IP has to offer; Without the telephone, it's a dead duck. Not lame; Dead.

There IS NO global amateur TCP/IP Radio network. None at all. These people want to tear down all that we have proudly done with radios, HF, H-S VHF/UHF,
AMSAT, ect, and have NOTHING to offer in return except utter dependence on the telephone for the bulk of our communications.

They kinda missed the general point of Ham Radio, if you get my drift..
It's not just that we use radios.. We use radios and we don't deliberately do things to lessen the enjoyment of other hams. In other words, we at least
pretend to be gentlemen, sincerely devoted to furthering the cause of Amateur Radio.

The idea of deliberately destroying the existing global amateur radio digital
network, to replace it with telephone links is not my idea of advancing amateur radio, folks.

The idea of using the telephone to "route around" the dedicated hams who have moved our messages with radios so that their efforts and expertise are no longer wanted or appreciated does not strike me as gentlemanly conduct, either. It's a deliberate action which most assuredly has lessened the enjoyment of many really great hams. Most of these displaced hams are BBS SYSOPs, by the way... Routed around with telephone links, and rudely cut out of the BBS message forwarding network by thoughtless anti-ham-radio LandLine Lids whose final aim is to destroy the Packet Radio BBS network altogether.

That's right; The pioneers of the Amateur Packet Radio network who have done
the very most to bring about it's amazing development and worldwide growth are now being rudely displaced by a sub-clique of anti-ham TCP/IP Lids with telephones. Disgusting.

Several suggestions for eliminating the "LandLine Lid" problem have been put
forward. The most popular idea is to simply cut them out of our forwarding links by refusing to communicate with them. I don't feel this will prove to be effective. It won't really eliminate the problem, and it will do nothing to prevent future problems. The temptation will tend to increase rather than
decrease as Internet access becomes more commonplace... Let's nip it in the bud right now.
My personal leaning is toward a formal request for protective legislation against this specific problem, such as several other countries already have in place. Where Packet/Internet gateways are simply illegal, they have no LandLine Lid problem of course, and their Amateur Packet Radio networks have
continued to advance and grow while ours has been mired in this "radioless ham radio", amateur TCP/IP mess which has actually REVERSED our growth.
If we demand and obtain similar legal protection, the Amateur Packet Radio network in the U.S. will never again be menaced or endangered by LandLine Lids of any description, TCP/IP or otherwise.

I think it should be fairly obvious that a Radio-Only rule for "*** primary routing and transport of amateur radio network traffic ***" would tend to push us in the desired direction - that of addressing our problems by developing new, innovative ways to utilize RADIOS.
Also, by phrasing the regulation (roughly) in that manner, Packet/Internet gateways would NOT be outlawed, and could still provide a highly beneficial interface and data exchange point between the two networks. They would only be restrained from using the telephone links to transport messages intended for the Amateur Packet Radio network. (Internet Forwarding)

This would instantly transform Packet/Internet gateways from the parasitic liability they are today into an especially important ASSET to the Amateur Packet Radio network, with unlimited potential. You don't hear about these kind of applications right now because they do not fit in with the agenda of our present "leadership". Eliminate Internet Forwarding, and the Packet/Internet gateway will have a chance to mature and develop as an

Amateur Radio application, and of course then there will still be an Amateur
Packet Radio network for them to interact with and be a part of.
Yes, you heard right; I'm saying that Amateur Telephone is just as big a drag on amateur TCP/IP as it is on mainstream packet. If amateur TCP/IP is EVER to mature and gain any status as an amateur packet radio application, then "Amateur Telephone" will have to be firmly placed aside and left behind.
We NEED that pressure to solve our problems by being more clever in our use of radios, if we are to see rapid advancement.

As a BBS SYSOP, my suggestion to you is that we take rapid, effective steps to regain our network from these persons. I also would like to suggest that BBS SYSOPs have contributed much, much more to Amateur Packet Radio than all
the world's "packet experts" and amateur TCP/IP devotees combined. We, more than any other group are responsible for Amateur Packet Radio's amazingly rapid growth and worldwide utility as an independent, all-ham radio messaging network. When LandLine Lids disparage our activities, they have to do it on OUR network because THEY can't hack building one of their own, as we have.

The point: Don't take any crud off of LandLine Lid parasites who don't even
HAVE a network.

Don't take any more of being "run down", don't take any more whining complaints, don't take any more vandalism of OUR network!

Comments, fellow Hams and SYSOPs? Don't you think it's about time the HAMS on this network pulled together a bit, so we can get past this problem and resume building and improving our network?

That seems like a cop-out to me. One could still post bulletins on
packet, and do correspondence by e-mail.

>The down side to being President. While there is nothing in the rules
>against this since I don't get paid as President and TAPR is a non-profit
>group, I personally don't think that it is a good thing. SO, I am no
>longer reading packet radio BBSs for e-mail. Also, spending hours
>accessing the local BBS is not what I do in amateur radio these days. I

Then you're behind the software curve. WinPacket will let you
completely automate your BBSing. It can be set to connect to the BBS
late at night, post your stuff, get your personal mail, and download
bulletins based on all sorts of criteria. I spend a fraction of the
time on the BBS that I did before I got WinP, and I don't even have it
completely automated, since I'm a remote SysOp, and need to pay closer
attention to what's going on with the system.

>>Not amateur radio, the packet network. From where I sit, packet is on

>
>I can't disagree more. All depends on where you are. Some networks are
>better now then they where in 1990. Your network - in your part of the

Locally, yes. Over much of the US, at least, the interconnections are much worse, from everything I've been able to see. Without the Internet connections, a national net wouldn't even exist, as a practical matter.

>world, might be worse off, but not everyone is in this boat. VHF/UHF
>packet radio is different in every 50-60 mile radius, or there abouts.
>Then again, what do you mean by 'packet radio' ? If you mean just
>networking and BBSs -- could be. Nothing has changed since 1985 -- which

Lots of things have changed, some for the better, some for the worse. We could easily have a 9600 baud network linking the PNW region which would easily handle far more traffic than is currently necessary. Most of the sites are already there, and equipment is available. All we need is a whole lot less infighting and lockouts, and a little bit more cooperation and enthusiasm. If you think new technology is going to change that, I'm afraid you're in for a big surprise.

>was the point of the article I posted. The areas that have new life are
>the new technology aspects -- APRS and others. Networks and BBS
>operators represented the 1% of the packet community. 1% is not very many

But that alleged 1% is what makes it possible for the other 99% to operate. I don't see your point at all.

>to support systems that a mass of the population don't use anymore,
>because things didn't change for the better -- but stayed the same.

We've improved our local network immensely in the last 7 or 8 years, and yet there's less participation than ever. People are just not interested any more.

>One thing that Charles and others have never understood is there is
>nothing stopping amateur radio from building the national network they
>want, other then the cost, people power, and that with the technology
>they want to implement it with it will never work well enough to get from
>point East to point West. Just read the paper that Tom McDermott, N5EG,

It did it in the early 1990s, and did it quite well. I used to get mail through my board from everywhere in the world, headed for the PNW. I once got a message from Moscow, Russia, through my system headed for Seattle via W3IWI, which was delivered in three days. This was long before folks started using the Internet for packet. Most or all of those links have disappeared.

>Tom's paper shows that you can't manage a network after a certain size
>based on the technology that is implemented by AX.25 packet radio as many
>use today. The solution is that you have to have long-haul distance
>connections. Now Hank will say that HF then should be used. However, HF

I have a lot of respect for Hank's opinion. He can be opinionated, and he can be wrong, but I've found him to be quite rational and approachable.

>is not fast enough to support what people want to do today -- it was in

Then make it faster.

>1984 when we had a fraction of the users that where happy at just sending

HF moved a LOT of mail a few years ago. With Clover and Pactor II, it
should be able to handle even more now. It'll damn sure handle more
than what we've been getting here via an Internet connection.

>private e-mail messages. We have to develop gateways and bridges to do
>this that use new technology then old and tried methods. These will
>someday be balloons at 21Km (see Sky Station -- maybe we can get a
>amateur radio payload on board one day) ? AMSAT satellites ? The

Sure. No quarrel. It's the dependence on the Internet that I
question. If we connect all the BBSs by Internet, why do we even need
Ham packet? The Internet will likely always be faster and cheaper.

<rationalization for use of the Internet snipped>

Your handwaving is all well and good, but basically it just says that
hams should just go ahead and use the phone because it's too much work
to do it by Ham Radio. That's a pathetic argument, IMO.

>about it, but I don't have the right to insult, badger, and degrade

>want to get involved in personal debates like the one happening here.
>They just want to have fun and learn new things. This is only a hobby --
>for most folks ;-)

It's a hobby for *all* of us. If you have no more interest in your
hobby than to let others do all the "work," have all the "fun" and
learn all the good stuff, then perhaps you need a new hobby. You
can't "learn new things" by being a passive Appliance Op and not
taking the effort to download a few bulletins from the BBS on how this
stuff works, or should work. I started out knowing NOTHING, and got
to be a sort of local "expert" on packet, even though I was nowhere
near the level of a real expert. I've forgotten a good bit of it,
since I've gotten others interested in doing a lot of the stuff I was
doing.

>>Is it possible to take the SS technology (and possibly some of the

>conversations over e-mail and some of the TAPR SIGs with Charles and it
>doesn't work. I gave up. I told Charles I would be glad to debate him

Well, somebody needs to present the other side of the case, assuming
there is one. What you've posted here is a start, but it doesn't
convince me that Charles is completely wrong in his assessments.

> You get drowned out after a while and just stop. Charles and others can
>win the debate by just out shouting everyone else. This was one reason

Not true. Some of us have the ability to sort through the bullshit to
get to the core of the matter. We can't do this if no one is
effectively presenting the "other side."

>the TAPR NET and BBS SIGs chairs asked the TAPR System Mgmnt Committee
>after two years of asking for calm on the lists to just lock him out. If

Censorship is a big part of the problem with packet radio. It really
puts your position and your organization in a bad light if you are
locking out one of the pioneers of packet, just because you don't care
for his opinions. I speak of Hank here. I don't know the packet
qualifications of N5PVL.

>you want to see a good example of one-sided dialog by Charles, you should
>subscribe to the TCP- GROUP that Brian Kantor maintains. Since Charles
>can't post his messages on the TAPR lists he has just moved over to the
>TCP-GROUP and continues. Some very well presented four letter words
>being used in replies to others in that group. Someone asked the same

I don't need to do that to see how he operates. He's abrasive,
overbearing, and crude, but that doesn't necessarily invalidate his
arguments.

>question on BBS SIG about the lockout a few weeks ago. I kept a running
>count -- the group was 3 to 1 in favor of the decision. The group was
>just tired of the diatribe and flaming after two years.

Majority opinion doesn't mean diddley when it comes to facts. I don't
condone lockouts.

>Can't spend much more time on this thread. Takes me a long time to write

Thanks for this much, at least. You or somebody who represents your
position should be posting in this group regularly, and also on the
PBBS system. It's the only way to get your message out to the

masses.

P.S. You still haven't explained why Hank was locked out of TAPR
discussion groups.

As I recall from my own observations (I have not discussed this with either Greg or Lee or any of the group sysops,) Hank had the misfortune to make a somewhat inflammatory posting at roughly the same time as Charles finally got the sysop to the breaking point where he decided to remove anyone who posted in that manner. It was largely the timing. Many of Hanks packet messages have been forwarded to the various TAPR lists since then.

I think 'censorship' is far to an emotive word to use. I respect Hank
for the work he has done to develop the amateur BBS, together with his
opinions on RF mail forwarding, whilst not agreeing all the way.

If however, a person in similar standing were to appear in my local pub
and try to ram their opinions down the local's throats without invitation
or damn good justification, you would have a job to persuade us that by
kicking him/her out, we were guilty of 'censorship'.

In the amateur radio spirit .....

In article <01bc6894$59e10960$2d7141ce@n5pvl>,
n5pvl@texoma.com ("Charles Brabham") raises:

> The malaise which has affected Amateur Packet Radio over the last few years
> has manifested itself in several ways.

It's important to distinguish between mail/bulletin forwarding and 'live
linking'. Much of the HF / AMSAT mail routing paths are not capable of
carrying 'live linking' e.g. converse and keyboard-keyboard QSOs that are
a feature of TCP/IP. Indeed, all of the VHF RF paths I know of from the UK
to continental europe are reserved exclusively for mail forwarding and
not live linking.

A network of geo-stationary AMSAT birds could do wonders for the packet
system, and I suspect that AMSAT have very good reasons for not having
persued this route already. In the meantime, we must rely on restricted
HF bandwidth for a lot of (but not all - SATGATES !) inter-continental
RF linking, and I would like to hint at the idea that HF is not
the best tack to adopt for run-of-the-mill packet communications.

I would suggest that the scant agreed areas for HF digital communications
would best be set aside for:

1) Individual experimentation in digital communications by HF.

2) Test and Development of new HF digital communication techniques.

3) The forwarding of 'routine' messages and bulletins between amateurs
of developing countries where more efficient uses of our precious HF
bandwidth are not reasonably practical.

The above opinion respects the position of fellow radio amateurs who wish

to make use of 'mainstream' amateur radio modes of communication on HF,
and not see these bands swallowed up by packet.

> The depth of this malaise can also be seen in the pathetic, desperate
> attempt among amateur TCP/IP devotees to legitimize "radioless ham radio".

> These people have discovered that TCP/IP can't hack it as an Amateur Radio
> networking application, but they will not let it die a natural, honorable

> for the bulk of their communications and PRETEND it's amateur radio, just
> so long as they can go on using "amateur TCP/IP"...
> Weird, pathetic, and twisted, but true! "Radioless Ham Radio"!?! ;-)

I wouldn't worry about it then. If amateur TCP/IP is making so little
use of 'radio' then it will make an insignificant impact in amateur radio -

or is there a bit more to this than I thought ??

Let's get four things straight:

* The internet is a marvellous medium to disseminate information in support of mainstream amateur radio.

* Packet should also be a wonderful medium for such support as well.

* Individual radio amateurs are free to identify and choose not to use mail routes / live linking paths that are not 100% via RF.

* Radio amateurs are free to contact each other by means other than amateur radio - e.g. on the telephone or face-to-face at a club.

OK, I agree that "censorship" is technically incorrect. It's the
simplest word to use for this sort of selectivity, however.

>for the work he has done to develop the amateur BBS, together with his

But ham radio is not a private pub, it's more like a public park were
every citizen is welcome. So far, I've not seen any reason why Hank
should not be allowed to express his opinion on packet radio in a
group dedicated to packet, its present, and its future. One person
who alleges to have kept statistics says that 25% of the group
supported Hank's position and/or his right to express it. Elimination
of a full quarter of your participants seems pretty silly to me.

>So does anyone out there got any ideas

Well Jerry, I think only computers have the required patience for HF packet. Most of the time it is an extremely slow process, you might fall asleep between words.

I'd think that vhf packet is often a function of your location. Large cities often have the critical mass to make packet activity useful with BBSs and direct keyboard contacts. But if you are out in the vhf boondocks it's going to be difficult and probably not much fun!

Packet radio can be useful for automated traffic handling when there are relaying BBSs and digipeaters within reasonable distances. Ten years ago I operated the key BBS and traffic relay station in Cincinnati. It was interesting to come down in the morning and see the traffic that had passed through during the night, totally unattended.

I believe after the INITIAL charge - you had better go slow.

My gel cel says max 1.75 amps after first charge.

I would just find a good "wall toad" you know those little
transformers that all ht's come with, that is rated at 12v and
anywhere up to 1.0 amps, and hook it up for a while. Monitor with
Volt meter like you said.

Good luck

Dave

Your tunnel-vision is a pinhole.

A good technique to resolve severe tunnel-vision,
is to stop now and flip sides. Analyze what the other side is
doing, and make an argument for it.

You do not have to believe it, just study it. Only then
can you make an educated argument. The emotion is removed by
doing this. Too much emotion always ruins a good argument.

Come back in three weeks with a better argument. This one is
poor, and "primer style." An absolute F grade.

Good luck,

Prof. Sampson

Mostly attributed to the lack of vision. Been there, done that, is
the common coffee house thread. Give me something new, more
technical, less political.

> Your handwaving is all well and good, but basically it just says that
> hams should just go ahead and use the phone because it's too much work

Basically, you have oversimplified his argument. We're in about the
third paragraph from your switch from technical reasoning, to emotional
reasoning.

> condone lockouts.

If someone hogs your repeater with a continuous subject that everyone
else has completely lost interest in. What do you do? Let him hog the
channel? Let him interrupt every conversation? What do you do when
reasoning doesn't work? You either lose participants, or you take
action.

No, like, say, a 14.4 modem.

Once you leave pure FSK, all usefulness on radio evaporates (well
maybe 2400 QPSK modem is about the limit). That is, taking a 33.6
telephone modem and hooking it up through the atmosphere is much
different than taking a device designed to go through the atmosphere
and hooking it up to copper.

2722. HELP MFJ-1278B & MacAPRS

Dear Sir
Our Company in Taiwan.
AWT Communications Accessories
Are Professional Producer of The OEM/ODM
Communications Product.e are Producing The :
CB / VHF / UHF / 900Mhz RF Linear Amplifier!
Full Duplex GSM Cellular Phone Repeaters Amplifier!
SWR/Power Meter, VHF/UHF Antenna. Antenna Tuner!
Antenna Switch, Switching Power Supply etc*.
Our Product Have OEM / ODM To Japan & USA !
These are the popular & OEM machine of our product.
AWT-144H (Same Daiwa LA-2035R. & MFJ Mirage B-34-G)
AWT-2090H (Same Daiwa LA-2080HK.)
AWT-3090H (Same Daiwa LA-2090HK. & MFJ Mirage B-310-G)
(Special to Design Great For ICOM IC-706)
AWT-160VH(Same Tokyo HY-Power HL-160V/25.MFJ Mirage B-2560-G)
AWT-200VH(Same Daiwa LA-2190HK. & MFJ Mirage B-2520-G)
AWT-268DH(VHF/UHF DualBand Same MFJ Mirage BD-35)
We Hope We Can Do The Business With You.

If You have any need. Please Contact with us.
We Will Provide The Best Quality & Best Price To You.
http://www.awt.com.tw

>
> Like, say, Bell 202 for 1200 baud packet?

Dave ... I don't think that anyone is likely to claim that 1200 baud AFSK
using the Bell 202 standard is "optimum" in ANY way ... it was a kludge
that was used because it was widely available in cheap implementations
and would "work" (sort of) with the mike/speaker interface to an existing
2m radio, thus minimizing the cost of entry ...

Where people make the serious mistake is in actually believing that it
is a viable, rational approach in today's environment ... it is not.
The fact that the vast majority of users cling to this old technology
just like some cling to Morse code) and refuse to upgrade to anything
more efficient makes the amateur community look once again like a bunch
of "collectors of elecronic memoribilia (sp?)" rather than the electronics
experts and trained communicators that Part 97.1 expects ...

The stagnation of packet radio is simply the extension of the larger stagnation
that has taken place ... through the emphasis on Morse and playing games
over the technical side, as orchestrated, supported, and carried out by the
Archaic Retro Radio Luddites throught their policies and the "Incentive (to
pass
faster and faster Morse tests) Licensing" program and the code-based,
class-based
caste system it established ...

I disagree, Steve ... I have a patent on a very practical, proven technique that will allow, for example 16/64QAM to be efficiently transmitted in the mobile multipath environment at VHF/UHF ... the system includes a method of processing the received signal in a way that the adverse effects of the fading channel are characterized and removed in a process that could be called feedforward signal regeneration (where "regeneration" means "restoration" not "near oscillation.) This is not a SS technique, simply a modulation technique with higher spectral efficiency than those that employ simpler "constellations."

BTW ... the same hardware can also do a form of SSB, FM, and just about whatever else you'd like ... it's VERY flexible because most of the "hard' stuff is done in DSP ... which is cheap today and getting cheaper by the day ... hams with old-fashioned "ideals" will hate it, but the digital world is moving ever closer to the antenna and soon nothing much but the LNA and 1st mixer will be analog ... everything else will be done in the digital domain ...

Maybe because the people at TAPR have better things to do than
argure with Hank and Charles via packet bulletins, two guys who
obviously have a woodie for anything they don't like.

>- Is there any truth to the many accusations that TAPR is promoting
>use of the Internet as a linking method, to the detriment of the

I haven't seen them selling any telephone kits, so I doubt it. Is there any
truth to half of what you read in packet bulletins ? Have you been following
the Namibia baloney ? Anyone who believes that crap obviously never
sent email and lacks a very basic understanding of how email works.

>- Why has Hank Oredson W0RLI been banned from TAPR discussion groups?

Maybe because he's an obnoxious geek ? I never met him in person, but
from what he writes daily to packet bulletins, that's sure how he comes off
to me.

2729. Ultimeter Software Beta Testers Needed

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-25 00:00:00 UTC
From: n2ckh@cybercomm.net
Message-ID: <33887995.322242457@news.cybercomm.net>
Source record: 29989

Hello All,

I am currently involved in an independant development
effort of MS-Windows software in support of the
Peet Bros. Co. series of Ultimeter weather stations.

This software application, named SkyWarn/2001(tm),
is at present a 16 bit application that will run under
MS-Windows v3.1 and up. It fully supports the Ultimeter
models II, 500 and 2000 for near-real time data
display and logging. Furthermore, it completely
supports the Complete Record Mode of the 2000 for
access to long term data. At present the software is
in Alpha, with Beta being planned for the month of
June '97.

What I am looking for is volunteers, preferably one
or two from each state, and anywhere outside the U.S.,
for each of the three Ultimeter models. What is needed
to qualify is a willingness to test new software, that may
not always work correctly, and the required minimum
Intel 386DX25 PC (or compatiable) with 8MB RAM,
SVGA graphics, 800 x 600 or better in small fonts and
one of the Ultimeter models with all supporting sensors
for said model.

Anyone interested, please visit my website and either
use the beta form at the bottom of the main page or
send me an e-mail outlining your capabilities and
interest, additional preliminary information on the
software can be found at the website, along with
some sample screen captures. The URL is:

http://www.qth.com/n2ckh.bytewise.org

I would like to thank everyone for their time in reading
and considering the contents of this request.

/s/ Steve, N2CKH

>> your approval? Sorry, but that's not in the spirit of Amateur Radio.

>I think 'censorship' is far to an emotive word to use. I respect Hank
>for the work he has done to develop the amateur BBS, together with his
>opinions on RF mail forwarding, whilst not agreeing all the way.

>If however, a person in similar standing were to appear in my local pub
>and try to ram their opinions down the local's throats without invitation
>or damn good justification, you would have a job to persuade us that by
>kicking him/her out, we were guilty of 'censorship'.

Also he is using misinformation to backup his reasoning, and trusts that
nobody knows how things work on the Internet today. When people rectify
his claims, he just ignores them and continues to use the same misinformation.

Example: "all mail sent to .na addresses on the Internet is sent to
Namibia, where the poor Namibians have to pay for it and have to bounce
the mail with an error message."
This is just plain nonsense. It may have been true in the days of UUCP,
but today Namibia is directly connected, and one lookup in their nameserver
(or any of the secondaries located all over the world) will reveal that
the hostname doesn't exist. The mail never travels to Namibia, and the
error message is generated by the local mailserver.

However, Hank continues and continues to advocate this reason for changing to
.noam addresses. It gets boring and irritating.
(besides, he tries to convince us Europeans that just because he changed
.na to .noam, we somehow have to change .eu to .euro! that is even sillier)

> present any evidence that this is, in fact, the case.

This isn't a court. We don't care if anyone brings evidence, or not.
We don't even care that you disagree. The only thing we care about is
how nice it is without him.

> In any case, I find most of these arguments specious. Unless a person

> This is a far better solution than banning the person(s).

Too much work. For $15 I know some Koreans that will cut his fingers
off...
Better just to be nice and ban him. He's a toad anyway.

2740. Is Spread Spectrum The Answer?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-26 00:00:00 UTC
From: marty@trucom.com
Message-ID: <3388fac9.32911345@news.trucom.com>
Source record: 29860

Hello, Folks:

I have a feeling that I may catch a lot of flames for this one from the SS crowd, but...

I've done a lot of reading and testing the past year or so and was wondering if I am the only person who does not see Spread Spectrum (SS hereafter) to be the answer for high speed, high bandwidth packet networks.

Now, don't get me wrong... I fully support the continued experiments with SS that may lead to something valuable, but I am talking about real world, here and now applications.

After doing a lot of research, it has become clear to me that SS suffers from several major problems for practical use in a large network...

(1) There are no fully documented systems using SS that are cost effective that I have found.

(2) Most of the SS systems I have looked at require a lot of tweaking to get them to work, often meaning a near re-engineering of the system for each link.

(3) None of the real experts doing SS development (I am not one of them!) seem to be willing to develop a simple, reproducible SS system that can be used right now.

Based on what I have actually seen of packet networks and on what I have read other people say about their local networks, I think that most high speed packet networks fall into one of the following classes:

(A) There ain't one.

(B) The network is broken to some extent or another, often due to lack of repairs and/or updates.

(C) The network is 10 or more years out of date, still relying on old, slow links (sometimes 9600 bps, often 1200 bps).

So, what we really need is a "Plug And Play" network solution. SS does not, at this time, offer such ease of set up and operation. It may at some point in the future, but not now.

There are several options out there now, but one of the best that I have seen in terms of documentation and the ability to be reproduced

is the system being used in Slovenia. (see
http://lois.kud-fp.si/hamradio/packet.html for more information)

The Slovenian network uses high speed radio modems to allow speeds up to 1.2 Mbps. All of the shematics, PCB layouts, etc. are fully available. The fine folks there that are involved with the project are also very willing to help and answer questions.

It is worth noting that the Slovenian system uses simple techniques that are both time tested and understandable by, I suspect, most Hams.

Again, don't get the wrong idea here... I am not saying that the Slovenian system is better than SS, just that it is much easier to impliment and it is available now. A pair of 1.2 Mbps Slovenian style radio modems can be built in less than a week for less than $100.00. My experiements with SS took 6 weeks and nearly $200.00 to get working and they were still not right and only 56 Kbps.

I would encourage those doing SS development to continue to do so, but to perhaps shift the focus to real world applications. We need clear, reproducible designs that are simple to build, install, set up and operate.

And, perhaps even more important in the packet world where $$$ are hard to come by, we also need something that is inexpensive.

So, in closing, those interested in packet networking should take a close look at the Slovenian system (URL above) before jumping on the SS bandwagon.

It just seems that I am the only person out there who is not in love with SS as the solution for high speed packet.

Take Care & 73

Glen, not trying to start WW 3 here, but you should rephrase that first sentence to "HF moved a lot of JUNK ...." Elsewhere in your post you seemed to agree to the fact that people have lost interest. I think so too, and I can tell you why from my viewpoint over here. The packet "network" always was good at moving bulletins (junk). But it never was any good at moving personal messages. In the years that I have run a BBS here, it's been a battle to get mail routed back here to the users correctly. The closest we ever came was when we were running a satellite gateway out here. You have a BBS, what percentage of the daily bulletins interest you ? I forward 200 bulletins a day to the main BBS here. On a good day, the users read six or seven of them. I see little or nothing that I am interested in, and apparantly most users don't either. So the packet "network" is like a post office that delivers a lot of "junk mail" but looses all the letters.

>Your handwaving is all well and good, but basically it just says that
>hams should just go ahead and use the phone because it's too much work
>to do it by Ham Radio. That's a pathetic argument, IMO.

It's not a question of 'work'. It's a question of reliability. Everybody has email today, or damn near everybody. The internet is replacing packet because it's much more reliable - if I send you an email message via the internet, I get an answer back the next day, or in a few hours. If I send you packet mail, I might get an answer back in a week or ten days, or maybe never. People stopped riding horses to work when the car was invented. People stopped sending packet mail when the internet became popular and affordable for everybody, because it's much more reliable.

I have to use the internet to connect to the packet network in the U.S. because all the other alternatives are gone. The guy in Hawaii who used to relay our packet mail got bored and quit. The guy here in Guam who used to run the satellite gateway got bored and quit. They didn't go away because I started using the internet - I started using the internet BECAUSE they went away.

Even with an internet connection to the U.S. I don't get replies to any personal messages that go out of here for the same reason it was a problem before - nobody pays attention to routing except for systems two hops away from them. Nobody cares about personal mail. It's, as you said, "too much work". Users have lost interest. Too many 'sysops' never were interested.

One of the guys you mentioned, Charles, is always using the phrase 'international packet network'. He says the internet is destroying it. I sent him a packet message and asked him one time how we could destroy something that never existed. I never got an answer. We had a chance to build an international packet network at one time, and we blew it. There were small segments of it that worked fine, but we failed miserably on the big picture.

The big technical problem with the packet network, as I see it now, is that it consists of a bunch of systems run by people who need to spend a lot of time montoring their systems, and don't. The software available is no good because the routing system is entirely manual, and the reliability of the entire network is dependant on the weakest link - one guy who is sleeping and letting mail rot on his system or misrouting it can defeat what 49 others are doing correctly. There is no coordination, on an international scope. That's not a network. That's a kludge. In the umpteen years we have been slinging packet bulletins all over the place, we haven't been able to accomplish something as simple as a standard addressing scheme - here it is 1997 and we are still arguing about NA vs. NOAM. How well would the internet work if everyone who wanted to use it just made up their own IP number ?

I enjoy packet. Mostly, the DX cluster. I'm already running the cluster, so the BBS was a throw in for the event that somebody else may enjoy that too, and so I could feed bulletins to the BBS here which never had any for the past few years. If a new ham comes along and asks me what he can do with packet I tell him. "You can watch the DX spots on the cluster. You can talk keyboard to keyboard with other hams on the cluster, directly or via the conference mode. You can read ARRL or AMSAT or FOR SALE bulletins on the BBS. You can use APRS to watch KH2EI's wife drive around Guam in her car, or see if two other peoples houses have changed latitude or longitude after an earthquake. You can send packet mail to the other hams in Guam who are on packet." If he asks me "Can I send packet mail back and forth with my ham friend in Texas ?" should I lie to him and tell him yes ? Or should I tell him the truth - that internet email would be much more reliable for that purpose ?

I don't think we need to 'kick start' packet, Glen, I think we need to decide if it's not too late, and if I it isn't, we need to start over. We need to get coordinated - not only on a local level, but all the way up to the international level. I think we need new software that takes the routing decisions away from the sysop and routes things dynamically. For years we have forwarded tons of headers, first to make the FCC happy, second to update the white pages directory, and why we still continue, who knows. If a packet message gets delivered via A-B-C-D, when a user hits the SR button we need software that is smart enuff to route the message back again via D-C-B-A. Or maybe even smart enuff to compare routes and pick one that is better. After we get all that done, then we can start upgrading the hardware to make things a bit faster. With the system we have now, why bother to go to 56KB ? So we can loose mail faster ? Once we have it all in place and working, then we can go looking for some new users. Possible, I guess, but the comeback trail will be a long hard one.

Do I think it will happen ? No. An international packet network that really works is beyond the scope of ham radio, in my opinon. The internet has already

replaced the packet "network". Some people just don't want to see that it has. It seems to me that the pioneer you mentioned is spending a lot more time calling people LIDS than he is pioneering anything new. Some of the other pioneers have apparantly been done in by the indians. I think we need some new applications for packet radio if we are going to keep it alive. APRS was new. The DX cluster was new. What else can we figure out to do with packet radio that we haven't done yet ?

>lined up to sing an unbroken chorus of whining, complaining negativism, all
>aimed at the Amateur Packet Radio network and it's users. This has been

< the usual bla bla bla snipped ......>

You should be an authority on whinning Charles, as much of it as you do.
Your should also be an authority on records, as much as you are starting
to sound like a broken one. And you should be an authority on running things
down.

A quick question, Charles. Why are you posting the same thing here, on
the internet, that you post on the packet network ? Isn't your 'international
packet network' getting you enuff attention ? Does the media which you
so despise work better than your packet network ?

You have done a fine job in telling the whole world what's wrong with amateur
packet radio. You have diseminated your information to the point that there
is no place left for anyone to hide from it.

So now, Charles, that you have defined the problem so cleary, what are you and
Hank doing to fix it ? Other than whinning about it, that is ....

OK, you're talking about internet links. Links that tie one LAN to another. Sounds great, probably just the ticket. SS would definately be more expensive. Inside the LAN though, (the city) you want both high speed, and full duplex. Why settle for less. Inside the LAN you want SS, and the internets can be formed with point to point links as you suggest. In the company I work for, we use 400 kbps full-duplex as the internet speed (part of a T-1). It is quite acceptable. Inside the LAN, we have delays at 10 Mbps. Hams don't require this scale. That is, most of the networking would occur inside the LAN at speeds as low as 115 kbps. Very little would need to flow outside of it. I don't know how a 1.2 Mbps half-duplex link is comparable (or can be) to a full-duplex link, but I suspect it would be quite acceptable.

Since the organization you are starting is concerned about internets, you
are going to be better off with the type of system you have identified. What will be lacking, is the LAN. What are you going to internet from or to? What infrastructure requires a high speed half-duplex point to point link? There isn't one. Well, maybe a 9.6 bps or 1.2 bps one.

So the answer is yes and no. SS would be too expensive for an internet, and just right for a LAN. Just right, meaning acceptable speed and responce. If I have to wait "seconds" for an ACK, it is unacceptable in the LAN.

BAD BET!

A number of the Hams that I know, only have 286's in the shack, while
the "House" or Family (Kids) machine is a 386 or 486...

I have 4 286-laptops, and 2 286-desktop's in my workshop.
My wife has a 486-30 and my high end is a 586-60.
My kids (now grown) all have 386's to 686's.

Two of my laptops only have 1 meg. The rest have 4 to 6 meg.

"Why the 286's?", you might ask.
one: They work.
two: They were cheap.
three: They still work. And they come with battery backups.

And "Nut's to the guy, that said you can't write multitasking software
for win31..." You can if you know what you are doing. It's just easier
in WIN95, cause the "hard part" is built into the operating system.

Hell, I was multitasking Radio-Shack Color Computers years ago, and the
same is true of the original 8080 and 6800 systems as well. But that is
also when all of the diehards said that there was no place in Ham Radio
for Computers.

Oh, how I like it when everything comes full circle!

My advice to the vender... Build a Full Feature product for WIN-95,
then consider offering the same package, stripped down (within limits,
of course), for the Win31, MAC, and DOS markets.

Almost right. Visual Basic V5.0 will only compile for WIN95 or NT.

Visual V4.0 will create 16 bit code for use under WIN3, or it will
create 32 bit code for use under WIN95.

What you say is true for the more "classical" HC work (e.g., VJ compression).
The more recent work in HC tries to deal with some of the issues
you describe below. Since this is ongoing work, it is a bit of
a moving target, but that is the nature of IPv6. What I say below
is based on the most recent background I have and may have changed
recently.

In <EAoFE2.5J3@pe1chl> rob@pe1chl (Rob Janssen) writes:
>Header compression needs a link that is relatively error-free, or else
>it needs an underlying protocol that makes the link error-free.

AFAIK, This is mostly due to the delta coding used for TCP HC. For the UDP
and IP headers, the decoding state will change rarely for a particular CID.
If one only compress the IP header (most of the overhead in IPv6), then the
problem seems much less.

But, If one DOES decide to do the TCP header compression in this environment,
then the Degermark et al draft describes two techniques to ameliorate this.
The first involves reapplying the delta on the received segment a few times
to see if it causes the TCP checksum to succeed. The second involes a header
request that cauases the full header to be sent on request to the
decompressor. See the draft for more detail. These are new mechanisms,
so more work is needed to understand how they might work on real
radio links.

>IPv4
>is mostly run over AX.25 UI frames, you would need an AX.25 connection
>to transport header-compressed packets. This would be possible with IPv4
>as well.
>However, the loss of going to a VC is probably more than the gain of header
>compression in IPv4, especially on network links where traffic from many
>stations is interleaved and header compression is not so effective anyway.
>I have not seen anyone doing it.

>Yes. And also, header compression more or less assumes a single-session
>use of the link.

Again, the new work deals explicitly with multi-access links (As you would
get with AX.25 UI frames). This is mostly done by defining a distinct CID
state space at each decompressor for each compressor. The best way to do
this would be to use the link source address to index to the per-compressor
state table.

One thing you did not bring up is the issue of reordering. A multihop AX.25
path could result in packet reordering if different paths are followed due to
hop-by-hop congestion. (Does anyone do this in AX.25?) Again, they mention

with this with a few hacks that get around this.

> the SS crowd, but...

NO flames from here ... you're asking reasonable questions in
a non-attacking manner ... that's a LOT better than we get
from a lot of folks on the code/no-code issue, so it's refreshing.

> I've done a lot of reading and testing the past year or so and was
> wondering if I am the only person who does not see Spread Spectrum (SS
> hereafter) to be the answer for high speed, high bandwidth packet
> networks.

I don't believe that SS is necessarily THE answer, more like it may
be A PART OF THE answer ... "the answer" is likely to be quite a
bit more complicated than just a wave of the hand ...

> Now, don't get me wrong... I fully support the continued experiments
> with SS that may lead to something valuable, but I am talking about
> real world, here and now applications.

OK ...

> After doing a lot of research, it has become clear to me that SS
> suffers from several major problems for practical use in a large
> network...
>
> (1) There are no fully documented systems using SS that are cost
> effective that I have found.

SS is being used in lots of consumer products (like cordless phones
and wireless LANs) that are designed for the high volume retail market
with price points in the sub-$100 range at the low end (featureless,
vanilla cordless phones) to the several hundred dollar range (high-end,
feature-laden phones and wireless LAN stuff) ... none of these are likely
to be a "drop-in" solution for ham packet networks, nor are packet networks
the only potential application for SS technology ... for example, the vast
majority of today's VHF/UHF-FM repeaters could be replaced in a FAR more
efficient manner with a FH-SS system where each group has its own coordinated
hopping sequence, rather than trying to control access to a channel ...

The radios could easily be manufactured as cheaply as today's FM sets
if modern technology and design techniques were brought to bear, and a
lot of generally vacant time/bandwith product could be freed up for better uses

> (2) Most of the SS systems I have looked at require a lot of tweaking
> to get them to work, often meaning a near re-engineering of the system
> for each link.

I am afraid I don't have a clue as to what you're referring to here ... could
you elaborate a bit??? As one who works in the field, I don't understand what
you're talking about ... this is clearly not the case with commercial systems.

> (3) None of the real experts doing SS development (I am not one of
> them!) seem to be willing to develop a simple, reproducible SS system
> that can be used right now.

For what purpose? There's a lot of effort and expense involved in doing what
you suggest.

It's sad, but all evidence to date seems to point to the unfortunate
reality that most current appliance-operating users are unwilling to invest
even
minimally in new technology. 9600 baud has been cheap and doable for the
"plug & play" market for a LONG time now, but the vast majority have refused
to upgrade even to that level, preferring to stay with their 1200 baud AFSK
kludges from a decade ago and bitch about how poor packet is compared to
the internet.

SS "enjoys" and even worse position, being unfairly cast in the role of
"destroyer" by those who seek to maintaining the status quo forever
in their efforts to maintain defacto control over "their piece of the pie" (a
coordinated repeater channel pair that sits idle 95% of the time) or by the
"weak signal" crowd who blindly accept the idea that SS will bring an end
to any possibilitity of pursuing their interests ...

In short, it seems that, despite its potential benefits, SS has a long,
rough road ahead of it in gaining widespread use and acceptance in the
ham community ... this is sad in several respects ... we should be
leading the way with this technology, ham radio is *supposed* to be
the ideal experimental test-bed for this sort of technology, but we're too
busy protecting the vestiges of the past to comprehend the advantages
of moving towards the future ... I predict that SS will eventually gain
acceptance, but only after a long struggle and a lot of unnecessary
bickering, bitching, fearmongering, and obstructionsim by the
"traditionalists."

> Based on what I have actually seen of packet networks and on what I
> have read other people say about their local networks, I think that
> most high speed packet networks fall into one of the following
> classes:
>
> (A) There ain't one.

A is the answer, plain and simple in the vast majority of places.
There are a few exceptions, but they're restricted to those isolated
locales where there exist a small enclave of experimenters.

> (B) The network is broken to some extent or another, often due to lack
> of repairs and/or updates.
>
> (C) The network is 10 or more years out of date, still relying on old,

>
> So, what we really need is a "Plug And Play" network solution. SS does
> not, at this time, offer such ease of set up and operation. It may at
> some point in the future, but not now.

I agree that there needs to exist a more "P&P" solution, because of the
unfortunate reality that most potential users are not competent to design
and implement systems from scratch ... we need to improve the level
of technical competence in our ranks, but we also need to take advantage
of those who currently know how to do useful things by translating their
knowledge into reproduceable designs ...

> There are several options out there now, but one of the best that I
> have seen in terms of documentation and the ability to be reproduced
> is the system being used in Slovenia. (see
> http://lois.kud-fp.si/hamradio/packet.html for more information)

This is not an entirely bad starting point, but the simple relatively wideband
FSK techniques have both advantages and disadvantages ... while they are
relatively simple to implement, they will have a hard time finding space in
most
US bandplans, where substantially unused repeaters are "coordinated" into
perpetual dominance over spectrum that's vacant 95% ot the time.

> I would encourage those doing SS development to continue to do so, but
> to perhaps shift the focus to real world applications. We need clear,
> reproducible designs that are simple to build, install, set up and
> operate.

Agreed ...

> And, perhaps even more important in the packet world where $$$ are
> hard to come by, we also need something that is inexpensive.

I tend to dislike the seemingly constant emphasis on "cheap" ... most
of the people who bitch the loudest about spending a couple of hundred
bucks on "a TNC" (I use the quotes, because I believe that paradigm to
be antiquated) will think nothing about going out and dropping the same
amount on a new set of golf clubs, or a couple of grand on a new PC or
a new HF rig ...

> So, in closing, those interested in packet networking should take a
> close look at the Slovenian system (URL above) before jumping on the
> SS bandwagon.
>
> It just seems that I am the only person out there who is not in love
> with SS as the solution for high speed packet.

Marty ... in closing, I agree with you that SS is not a panacea ... it is merely one of a number of techniques that we should be testing and experimenting with and applying, where appropriate, to the meet the needs of the amateur service for increasing spectral efficienty and technical progress ..

Perhaps, but there's a good argument to be made that the Internet
gateways are helping in that demise. I'd like to see more rational
discussion on this, rather than the namecalling that prevails on the
BBSs and even here in this forum.

>Barry VE3JF (member, TAPR Board of Directors)

Once again, thanks for shedding some light on this topic. I'm looking
for facts, ideas, and solutions, not for some data to reinforce an
agenda. You've given me some valuable information. Perhaps others
will do likewise.

Something else that would help is software/hardware that would
facilitate interface between old and new systems, so that newer
systems could be integrated into the old system a bit at a time, so
that we wouldn't have the problems inherent in the chicken/egg
syndrome. Any new technology should include a method of translation
at the node site so that a New Tech backbone, for instance, could
interface with an Old Tech system, and provide 1200/9600 baud ports
for the mass of users who still have those systems.

True 286's are out there, but unfortunately they truly were the dog of Intel lineage. Anyway, 386sx machines can be had for 15 bucks or less nowadays if you lower your standards. Also, the Win32s kernel addon for 3.1 from my understanding, is capable of true mutlitasking, just like 95. Win32s was the test bed for 95. And the newest versions don't do that bad in the stability department (well, in terms of non-NT4.0 windows anyway). I have it on word from someone in the know that win3.1 w/win32s extensions would be able to run win 95 apps, if it weren't for the addition of a kernel call tells a program what win32 version it is running on.

Thomas Sailer (sailer@ife.ee.ethz.ch):

: Can you tell me the manufacturer and part number of your
: multi IO chip?

Hello...i aplied the ax25-module-13a patch to the 2.0.30 linux kernel
and compiled it again to work on my 386dx40 and the P166 of my friend.
work perfectly on my 386dx40 (uart 8250) with the ax25-utils-2.1.37a
but with the PC of my friend it didn't... It didn't hang but it doesn't
work either... when i make cat /proc/interrupts the baycom_ser12 value
only increases when i load the driver,ie, 2 interrupts the first time
and stays there forever...

if i load like this

insmod baycom [io,irq,mode parameters]
ifconfig [parameters] up

it appears at the /proc/interrupts

but when i load:

insmod baycom
sethdlc [parameters of io, irq,etc]
ifconfig [parameters] up
it responds whith some SIOCTL device not found or something
I type cat /proc/net/dev and there it is but not at /proc/interrupts!

tried with the old ifconfig and with the new net-tools-1.33a ifconfig with
no luck :(
it seems that the driver can't initialize the UART correctly.

So, here's his MB chips and other stuff:

PT-5IVL based on 82430VX PCIset and Winbon I/O chipset
I/O Ports: 2 high speed serial ports, one LPT SPP/EPP/ECP. floppy disk
control port (2 high speed NS16C550 compatible serial ports)
IR Port : InfraRed fucntions both HPSIR and ASKIR

PC System ChipSet: Intel 82430VX PCIset (82437VX, 82438VX, 82371SB)
I/O ChipSet: Winbond W83877F
BIOS: Award system BIOS.

>action.

We have only ONE rule on our repeaters, in addition to the obvious
Part 97 rules. This rule is quite simple:

"Thou shalt not piss off the guy who goes to the mountain to keep the
machines running."

We've seldom had any problems, and in rare cases, we find that
completely ignoring the lid solves the problem nicely.(*)

Of course, you're avoiding the fact that a packet network is NOTHING
like a repeater. If you get locked out of a repeater, it's a fairly
trivial matter to find another one, or set up your own.

If you get locked out of a wide area packet network, it's not so easy
to find an alternative. And if you get banned from a discussion group
that has as its purpose the discussion of the future of packet, what
viable alternative do you have?

It has been implied that Hank is nothing but a disruptive troublemaker
with nothing constructive to add to a discussion of packet. I
challenge anyone to show convincing evidence of this, and to
demonstrate that banning him (and others like him) is a better
solution than simply ignoring his input.

The fact is that if somebody is pissing off the Powers That Be,
there's a damn good chance that what he's saying has some value, or
the PTB wouldn't be so worried about silencing him. ObJoeBobBriggs:
I'm surprised I have to explain these things to you.

(*) Actually, back in the beginning, when I was just getting involved
with putting up repeaters, we did try to lock certain undesirables out
of our system. We eventually discovered that this created far more
ill will than it prevented, for various reasons that should be obvious

to anyone who's dealt with such things extensively. Have you ever been locked out of a system for no rational reason? I have.

In any case, there are much better ways to deal with troublemakers, and you lose a lot less sleep by forgetting about lockouts. No legitimate hams are locked out of any of our systems. It works out better that way.

>for excluding certain people from a discussion group.

Perhaps. Assuming that's a valid reason, I've yet to see anyone present any evidence that this is, in fact, the case. The only data I've seen indicates that 25% of the group (at least) opposed this alleged banning. In fact, I don't recall anyone even admitting that Hank Oredson *has* been banned. I'm trying to discover the truth here.

In any case, I find most of these arguments specious. Unless a person is flooding the group with dozens of messages a day, it's a trivial matter to killfile or ignore posts by someone known to be a "problem." This is a far better solution than banning the person(s).

I agree. This is why wide-area amateur network which are completely radio-based are doomed to failure. To set up and maintain an effective network infrastructure takes good planning, sound engineering, money and time. Hams who are willing and able to build such a network on a volunteer basis are few and far between. Those that do take the plunge eventually find themselves in a situation that looks and feels much like a fulltime unpaid job (a situation I am intimately acquainted with!) Amateur radio politics rears its ugly head - protocol wars break out, and users of the traditional analog modes scramble to protect their turf from the digital invaders. Pretty soon it isn't much fun anymore.

Add to this the problem of declining interest. The packet network was developed around the PBBS model, which offers email, news and file downloads to local users. This was pretty interesting when it was the only game in town. Near-ubiquitous Internet access has changed all that. Why use the stodgy BBS interface for mail and news when you can use slick mail and newsreading tools to do it on the net? Why restrict yourself to the small selection of files available on your local PBBS, when the whole world is accessible by ftp? Why waste time with BBS's when you can browse what the world has to offer on the web, or take part in real-time multi-user conferences with participants from around the world, using text, audio and video? The chances of attracting young people to the hobby with the PBBS network as an enticement are virtually nil.

So, if amateur packet radio is to become healthy again, there are two problems to solve: building networks that are maintainable without burning out the responsible people, and giving the networks the performance and applications which will reverse the current trend of declining interest and lack of new blood in the hobby. To solve the first, we must abandon the idea of radio-based WANs, and instead focus on LANs and MANs. For maintainability, the

coverage of a given network should be relatively small - nodes should be home-based or in easily accessible locations (not a 4 hour round trip in a 4X4 away), and not involve coordination between different groups who may not see eye to eye. So, in terms of the extent of the radio-based networks, we need to lower our expectations - but on the up side, we now have a network on a scale such that we can greatly increase the performance, thus attacking the second problem. Instead of dissipating our energies in a losing battle to extend the radio network, we can use the Internet to link our LANs and MANs, and concentrate instead on improving local network performance - "think globally, act locally".

With the advent of ISDN, ADSL, cable modems et al, increasing the bandwidth of radio LANs won't necessarily provide an irresistable attraction, but if we add mobility to the mix, then we'll have something quite unique. Picture having a spread spectrum MAN offering something of the order of 1-2 Mbps. You could put together a nifty portable setup consisting of SS modem, notebook PC, camera and microphone, and deploy it anywhere in the coverage area of the MAN. How about a setup at your club's Field Day operation, putting live video and audio on the net? Think of the other special events and emergency situations where a portable video/audio/text station could be used to good effect. You could attract the attention of possible future hams by putting your club meetings on the net (on second thought, this could be a turnoff :-). You get the idea... to revitalize packet radio, we need to be working on much higher speeds, multimedia applications, mobile IP, multicast protocols, and so on.

>This was all very interesting, but it does NOT address the issue I
>raised in my original post. I still have a few questions.
>
>- Why do I not see the TAPR side of this controversy in *packet radio*
>bulletins?

Speaking for myself, because there are only so many hours in the day.
I used to read, and sometimes respond to, the PBBS bulletins, but I gave it up because the signal-to-noise ratio was too low, and the interface too cumbersome. I find that Internet mailing lists tend to be more focused (with some notable exceptions, of course) and less time-consuming to read. If I have some extra time, I'll check out some of the Usenet newsgroups.

>- Is there any truth to the many accusations that TAPR is promoting
>use of the Internet as a linking method, to the detriment of the
>existing ham RF links?

Not in direct way that I'm aware of. I've been much involved in packet-Internet gateway development - I started one of the very first ones, and still maintain it. I've never noticed any particular encouragement from TAPR to open gateways. However, TAPR is promoting the concept of higher-speed LANs and MANs, and it's no secret that the Internet is a good way to link them.

TAPR is not attacking the existing packet network - it's simply dying of
natural causes.

>- Why has Hank Oredson W0RLI been banned from TAPR discussion groups?

I don't know the full story about that, but I'm on one of the groups that
Hank used to participate in (the networking SIG). After an unpleasant
flamefest and general rise in the noise level, a decision was made to make
it a moderated group - all submissions had to be approved by the moderator
before they would be distributed to the group. I remember very clearly that
after this decision, Hank promptly announced that he would not take part in
a moderated discussion group, and that he would be leaving forthwith. So,
there was no ban in the case of that group - he left of his own volition.
I don't have any knowledge about what may have happened in other groups.

You didn't post what VOLTAGE your gel cell was designed for!

Without that, or some way to figure out from the description of a
part number that we might be able to cross reference to voltage,
there is no answer to the question!

Plugging a 1.5 volt gel cell into a 12 volt nominal charger could
be a disaster! :)

Now to anticipte a bit... :) If this *IS* a nominal 12 volt cell, then
you can charge it with any charger that has more voltage than the level

to which it has decayed. So-called 12 volt lead-acid car batteries have a peak charging(ed) voltage of about 13.6 volts DC. The higher the charging voltage is across a discharged cell, the higher will be the current drawn. At roughly the 13.6 volt level, when the battery becomes fully charged, the current will go down.

Your 500 MA charger may or may not have current protection in it. It *might* be suitable to charge the gel cell, assuming the design voltage range for it is OK for the cell. It may be that it will work fine, just take about 14-20 hours to fully charge the cell. An ammeter in series with the charger will telll you if the draw is over the 500 MA level or not, assuming the whole mess is the same nominal voltage level.

Batteries that are *identical* can, sometimes, be connected in parallel. Note that even they be physically alike, the cells inside them may be slightly different due to aging. Therefore, yes, you can gain current capacity this way and also gain run time for equipment fed with batteries in parallel, but be prepared to also find out that one battery may actually discharge the other one due to a weak cell you do not know about!.

The most important thing to know about all this is something you touched on, but didn't comment about. Be *very* sure, when you parallel two batteries, *not* to get the polarity wrong. Of course there will be lots of sparks if you make an error, but less often, should you get things welded together or clamped solidly, by accident, you can be a *very* badly hurt soul. Under massive charge/discharge scenarios, batteries EXPLODE. Mis-used, they can burn you, blow acid on you, blind you or whatever, and, set fire to things all around them.

High capacity alkaline cells are a real problem for this, as are gel cells.

I hope nobody takes you to task for posting your request. A lot of us may not realize you may be a book ham. We were all that, once. I've tried to help with what you asked in that light.... assuming you were seriously asking for help...

Hi !!
I need to how to setup the packet configuration to use
DX4WIN with the Baycom interface.
Th Baycom I use a very simple one using the IC TMC3105.
I don't know if I need to run any emulator (like L2 or S2)
before running DX4WIN.
If anyone has already solved this problem or has any ideas please
e-mail !!

thanks !

I'll see if I can help 'balance the books' .....

Granted that the AX25 RF based mail network is capable of getting
messages from one side of the globe to another, but I think that
a sizeable quantity of amateurs additionally like to:

* Explore packet networks in real time

* Conduct live QSOs on the keyboard.

* Enjoy new packet applications that enhance their enjoyment of
'mainstream' amateur radio activities.

* Discover new amateur radio based resources (via e.g. FTP and REQSVR)
that can help add to their own knowledge.

I think a lot of the 'anti-gateway' sentiment comes from some amateurs
substantially more interested in RF digital networking techniques than the
users are - the latter are more interested in content than technique, and if
this content can be more readily found on the internet than the packet
networks at reasonable cost, then packet could possibly lose quite a few
users.

To preserve the packet user base, I would initially suggest that packet
should:

* Provide services of interest to radio amateurs not found on the internet

and / or:

* Provide a similar level of service to radio amateurs at a convenience
advantage with less cost to the user.

Where the internet gateway makes its mark is in the rapid transmission
of data over long distances ... great for real time comms, and in satisfying
the four reasons detailed above that the users love !

The downside is that damage can be inflicted on the worthwhile AMSAT
SATGATE operation, and other projects involving the evaluation of new
digital modes under heavy load if inet gates are used irresponsibly
for forwarding of non-time-critical mail where these mail paths exist,
and their operators handle all traffic presented.

If you also consider the grief regularly caused by improperly configured import/ export methods of mail forwarding using telephone modems, then I think that this is the major reason for the venom directed against 'land-line lids'. TCP/IP Internet gateway sites are often capable of shifting PBBS mail using 'native' forwarding protocols as if the traffic were going over-the-air, and avoiding these disasters.

A good acid test may be whether there has been a growth or decline in RF packet activity in the vicinity of internet gateways. Speaking personally, in my area it appears to have grown than it otherwise might, and local RF network providers are heavily influenced in favour of providing additional RF links which lead to such gateways.

73, Gareth

>invented. People stopped sending packet mail when the internet became
>popular and affordable for everybody, because it's much more reliable.

Agreed. *Important* personal mail was never the best use of packet,
and it's even less use now. We need other ways to attract users.
Some folks have started experimenting with HTML, to the predictable
screams of some operators.

>used to run the satellite gateway got bored and quit. They didn't go
>away because I started using the internet - I started using the internet
>BECAUSE they went away.

That may be true in your case, and even in ours, but I don't believe
it's true in every case. I don't have a horse in either race; I'm
looking for information and ideas, which are hard to come by in the
midst of censorship and flame wars.

>from them. Nobody cares about personal mail. It's, as you said, "too much
>work". Users have lost interest. Too many 'sysops' never were interested.

Well, all I can tell you is that personal mail got quick attention
here, and still does. Back when we had reliable links out of the
area, a majority of our personal mail WAS delivered, and relatively
promptly, too.

>One of the guys you mentioned, Charles, is always using the phrase
>'international packet network'. He says the internet is destroying it. I sent

Charles is prolix and abrasive, but at least he and his cohorts are
presenting their side of the story. If others had presented their
side as well and as persistently, perhaps I wouldn't be here looking
for answers.

>The big technical problem with the packet network, as I see it now, is that it

>simple as a standard addressing scheme - here it is 1997 and we are still
>arguing about NA vs. NOAM. How well would the internet work if everyone
>who wanted to use it just made up their own IP number ?

All excellent points. But how do we address them? Most of the
workable solutions are contrary either to the rules or to the spirit
of Amateur Radio. This is one area where the ARRL has failed
miserably, IMO. If I recall correctly, back when packet was starting,
the ARRL got the factions together and applied pressure for a
standard, with the result that we got ax.25 and the TNC-1. Feel free
to correct me if I recall the details wrong. The ARRL should have
provided leadership in the ensuing years to address some or most of
the points you raised. Some coordination and standardization might
have kept us from falling into this morass.

<ideas snipped, no argument here>

>Do I think it will happen ? No. An international packet network that really
>works is beyond the scope of ham radio, in my opinon. The internet has already
>replaced the packet "network". Some people just don't want to see that it has.

Way back in the late '70s or early '80s when I saw the first articles
in "73" Magazine (why weren't they in QST, dammit?) I said to a friend
"This is a neat concept, but it's never going to reach its potential,
because you cannot get hams to cooperate with each other to the extent
that's going to be needed to make this thing work." I'm sad to see
that my prediction was exactly correct. Actually, we made more
progress than I thought we would, but when TheNet added lockout
capability to node firmware, it marked the beginning of the end of a

viable network. If you want my real pessimistic opinion, I think
packet in the US has seen its best days, and it's only a matter of
time before it's just a footnote, like RTTY or SSTV. We can't even
handle routine ARL traffic efficiently, and that was one of the things
that packet was ideally suited for.

>It seems to me that the pioneer you mentioned is spending a lot more time
>calling people LIDS than he is pioneering anything new. Some of the other

Well, perhaps, but at least he still seems to have his enthusiasm for
the mode, and still supports his software. We run AA4RE here. I find
it to be a superior BBS package, but it hasn't been updated in several
years, and I doubt it ever will be. BBS authors haven't even settled
on a compression scheme, which would save at least half the bandwidth
we're using now.

>pioneers have apparantly been done in by the indians. I think we need some new
>applications for packet radio if we are going to keep it alive. APRS was new.
>The DX cluster was new. What else can we figure out to do with packet radio
>that we haven't done yet ?

Packet Cluster isn't new. It's been around almost as long as NetRom.
It's a complete waste of time, as far as I'm concerned, but others
obviously disagree. If the Cluster folks had helped improve the
existing network, instead of insisting on building their own, separate
net, perhaps we'd still have our links out of the area. I know the
two will co-exist, because we let the Cluster folks use one of our
more fragile links for quite some time, and it didn't seem to clog up
the channel too much.

: : We originally solved this with a higher layer protocol rather than the
: : hardware.

: humm... can't it be done at the hardware level? like some kind of mixer
: with 2 inputs.One the received 45MHz signal and the other a V.C.O.
: controled by the data transmited?
: when it told be that it was made at the software level i couldn't imagine
: how could you get full-duplex. can you explain it to me?

Yes, there is probably a fairly easy hardware solution, however I'm
not convinced that it is worth the effort. If one simultaneously
modulates the 2nd LO (the one for the receiver) in the opposite
direction and at approximately the same amount, the resulting local IF
will be devoid of the outgoing signal. This means that each station
will hear the *other* end of the link's signal at the same time it is
transmitting. That's FDX. However, doing this requires twice the
bandwidth and twice the modulation index which is something that the
inexpensive motion detector oscillators probably will not be able to
provide, at least at higher data rates.

Our solution was to set MTU and Window size equal and let the protocol
deal with any lost packets. Remember that a link like this normally has
only two ends and any collisions will be self-inflicted. Our approach
seemed to work OK. Full duplex in RF hardware often requires more
effort than doubling (or quadrupling) the data rate of a simplex link.

: : See the web pages for experiences (successful) at running Ethernet cards
: : at 2 MBps. I believe that users in Belgium have run the link with RS232

: My problem is getting the 2Mbps cards ... i only have 10Mb/s baseT and
: base2

The pages detail using standard 10 MBps Ethernet cards at 2 Mbps.

: : The 230 kbps network hardware is running using 900 MHz radios, not the
: : 10 GHz ones. The Ottawa PI cards which interface them to the computers
: Well, this question was to inspect why aren't you using the uwave stuff?

Again *please* see the pages. I put them there to help explain the
theory and our experiences in the development of higher speed
networking.

As I've said many times since as well as in the original article, the microwave link was intended far more as a demonstration of the value of microwave and the attendant high directivity antennas for economical information transfer than it was as the "final solution" to amateur networking needs. If for no other reason than the environmental one, the hardware shown is not very suitable for continuous outdoor operation.
The 230 kbps h/w was very inexpensive due to the low cost of surplus components (at the time). It offered the possibility of moderate data rates with slightly wider antenna beamwidths than a 10 GHz solution. As I was trying to build a prototype network on a budget largely funded by the sale of an HF SSB transceiver, I chose 900 MHz. The 230 kbps speed was dictated by the maximum rate at which I could get readily available interfaces(Ottawa PI cards) to do internal clock recovery.
It now appears that Ethernet cards with modified clocks might have worked as well.

Although we've been using the simple FSK 230 kbps hardware for many years now, future efforts are toward an even less expensive and more producible approach using spread spectrum and 'no-tune' surface mount RF printed circuit techniques.

: : I would not recommend this as a base design for a network to cover a
: : If you are considering a permanent, wide area network, I would suggest

: and why not? i'm really interested of making this experiment and to make
: improvements on the circuit... this project remebers me one that i've made
: a very long time ago when i designed/built a AFSK workable modem with only
: a frequency NE555 controled by the RS232 data at the fourth pin for Transmiter
: and a 4 AND Smith Trigger CMOS 4093 has receiver :)...i think i have the
: schematics somewere if someone would like to experiment :)))

This design is now more than 10 years old. It was intended as a 'teaser' to show the economics of highly directed energy for information transfer. In my opinion it was not then, nor is it now, the best way to get high data rates at low cost. It is possible for about the same price to get at least a 100-fold increase in data rate or performance through use of more appropriate components. It is basically a system of point-point hardware. The amateur climate doesn't support presently support growth of this very well.

: : Also please see the description of our current efforts with L3TNC and
: : on-channel active repeaters on these same pages.

: when i have the time i'll push the complete pages with the wget utility,
: but already checked the pages just to see what they contained.

Thank you. I'm sorry to have to keep saying "see the pages" but I put them there just so that some of the 1000+ requests for information I get might not occur via email, telephone(in the middle of the night my time) or even via newsgroups.
If the pages don't answer questions that need answering, please let me

know and I'll try to fix that so everyone can see it.

>thing for Amateur Radio, is it?

Hmm. And I suppose you blame the doctor when you get sick too?

Let's face it. Packet radio may be fun, but it is child's play
compared to the Internet. The internet is faster, more available, and
cheaper to access than packet radio. About the only strike against it
is that it isn't amateur radio, but that could also be considered a feature.

The current packet radio "network" is entirely inadequate to disseminating
information to a large number of radio amateurs. Surely that is obvious to
even the most casual observer. The fact that TAPR chooses to point that
out is not healthy or unhealthy, it just happens to be true.

I was at a friends house over the weekend operating a contest with a computer logging progra,. I was going to have the program access the DX cluster, but the program would not recognize the port. My friend told me that if any program other than the one he uses (KAGOLD) wants to access the controller, a hard reset must be performed with a jumper in the KAMPLUS. Does anyone know why this is the case?

This isn't totally accurate...KAGold leaves the KAM Plus in HOST mode, not in terminal mode. Many other programs (like CT and any "terminal" program) use the terminal mode to communicate with the KAM. Even then you can set KAGold to exit in terminal mode if you wish, or, you can use your terminal program to exit the host mode.

You could use something like Procomm Plus, and send the FEND-Q-FEND sequence to the KAM to exit host mode. To do this, hold the ALT key and type 192 on the numeric keypad, then release the ALT key, type the letter Q, and then repeat the ALT-192 sequence. You'll exit HOST mode (assuming you have the baud rate set properly).

So why forward them? (honest question, no flame)

One of the biggest "junk" problems with packet has always been that
every twit with two fingers to type with seems to think that the whole
world will die if they don't read their "I have a broken VIC-20 computer
for sale" message, so they address it to "ALLUS" or something like that ...

One of the best services someone could do for the packet community
would be to write a simple filter that would immediately kill any message
to ALLUS that contained the phrase "For Sale."

Does anyone know what the cable pin outs at both ends (DIN-8) connectors are for the above combination? A friend and I have tried to match the pin descriptions from the 775 manual to those in the KAM+ manual but the closest we get causes the Xcvr to go into xmit as soon as the KAM+ is turned on and go into receive when a RTTY xmit signal is sent. We're using the acc1 socket in the 775DSP rather than the microphone connector.

Thanks in advance,

Rob

I agree completely here. I am no big player in packet (as a matter of fact I've only played with it once in my life), but I am currently working on a MAN for the Raleigh, NC area. When I do it, I am going to go for the big time. Packet and amateur radio is in danger of stagnating. You, the pioneers, haven't kept amateur radio high tech. To bring fresh talent to packet, or amateur, you have to keep it on the bleeding edge within an hobbyists budget. Right now, that bleeding edge is the internet and gobs of flashy media, tons of email traffic, and easy access. If you can't provide any of these items, you may as well pack it up if you expect to get any of the mainstream young into fold. I am the young, I know where the draw comes from for the majority of my non ham friends to modern technology. If you could pipe internet to their homes over radio, they would pursue the hobby with new found enthusiasm. Right now US Robotics and Bell Labs are the ones leading the edge with transfer rates. What happened to amateur? Don't even try to answer that question. The problem is so fragmented and multifaceted it would be insane to try to answer. The solution to the problem that has risen though, is to get things back in gear and put the high tech and R&D back into radio and packet. This discussion is currently not getting anywhere except to get a few old rivals riled at each other. I haven't seen anything yet that has actually been a applicable solution (except Carl's narrow band ideas), of which there are many, only this ongoing argument and pinpoint analysis of the logic (or illogic) in each others posts, for the most part, and promotion of one's idea as better than

another at any cost. So, halt the flame war, work on high speed and reliability, and lets get the ball rolling here folks . . . if you don't, you can eventually kiss packet completely good bye, and without newcomers attracted by internet, eventually the rest of amateur radio along with it. Why allow the internet to assimilate us, when we have the bandwidth, the know how, and people to just attach the internet as another part of the hobby, and candy for the new comers?

Later,

If you have clean line of sight RF-paths between the stations with no objects within the Fresnel zones (in any weather conditions) you do not need SS or other fancy systems. However, if you are going to move data at any reasonable data rate in typical ham end user RF environment, you need something to combat the multipath.

IMO, the most interesting part of the Slovenian system is the low tech (BC FM IF filters etc.) medium speed end user radios. Not very spectrally or power efficient system, but affordable and easy to build for the end user. The use of the wide deviation (compared to the data rate) might also help in some multipath situations.

> intended!), True?

Don't try to put words in my mouth ... I didn't say, or imply, that.

First, the license to which I referred is NON-exclusive ... so I'm
free to license others as I see fit ...

Second, "not in the public domain" doesn't mean "not available
to amateur radio" ... I've never refused to talk to any of the ham
gear manufacturers ... though they haven't exactly come breaking
my door down ... I think it has something to do with the vast
majority of hams having a hard time accepting anything new and
different from "the way it's always been."
(the architecture is actually the ideal, optimum way to implement
a multi-mode radio ... but everybody seems to be hung up with
very conventional, complicated 3-4 conversion spur gardens ...)

This is a multi-part message in MIME format.

Below is a html address to the specs on a spread spectrum modem on a chip basically. I'm hazy on the rules of SS, would this chip be useable for packet radio? I want to setup a MAN in the Raleigh, NC area. Our club will have the neat privilege of full access to a 10Mbit ethernet line to our Shack at NC State (W4ATC). I'd like to get an internet gateway going, but since most of my friends and definitely myself are living in apartments, placing a dish on top of our dwelling just isn't gonna happen. Spread spectrum with a normal ground plane antenna looks like the only option (I was looking at 56000 but multipath seems to be a problem). Do you think a legal SS radio modem could be constructed from this chip?

http://www.amis.com/sx043_fs.html

Thanks,

Content-Disposition: inline; filename="sx043_fs.html"
Content-Base: "http://www.amis.com/sx043_fs.html"

SX043
Spread Spectrum Transceiver

August 1996

Data Sheet

1.0 Features

* Low power with user controlled `shutdown' modes.

* 3.3 volt (or 5.0 volt - H option) (+/- 10%). Contact AMI for SX043H data sheets.

* Narrow band and Spread Spectrum operation, independently selectable for transmit and receive.

* Performs all baseband functions required for implementation of direct sequence spread spectrum and can be used in any radio frequency band.

* User programmable transmission protocol with pass-through or packetization formatting.

* Generic microprocessor interface.

* Full or half duplex operation.

* High process gain (up to 2047 chips/bits) with data rates from 100 bps to 4 Mbps.

* Independent transmit and receive PN code generators.

* Gold code and 11-chip Barker code options.

* Programmable preamble lengths for faster acquisition when there has been recent transmission or reception.

* Byte wide transmit and receive data FIFOs.

* 16 or 32 bit CRC error checking.

* 8 or 16 bit receiver address.

* Optional data scrambling.

* Support for: Binary Phase Shift Keying (BPSK);

Differential Binary Phase Shift Keying (DBPSK);

Quadrature Phase Shift Keying (QPSK);

Differential Quadrature Phase Shift Keying (DQPSK);

8 & 16 Quadrature Amplitude Modulation (QAM).

* Continuous tracking feature, for transferring multiple packets of data at high data rates without re-acquiring signal-lock.

* Available in commercial or industrial temperature ranges.

2.0 Description

AMI's SX043 Spread Spectrum Transceiver simplifies the design of direct sequence spread spectrum radios. It contains all the baseband circuitry needed to implement a radio, thus providing an economical solution to the extensive digital hardware requirements of high performance spread spectrum radios.

The SX043 Transceiver IC consists of a microprocessor interface and full duplex transmit/receive message processor circuit. Included in the message processor transmit circuits are the data scrambler, packet generator, CRC generator, pseudo-noise (PN) code generator, and modulation mode formatter. The message processor receive circuits include the receive PN code generator, receive synchronization and tau-dither tracking loop, integrate and dump control, data descrambler, packet decoder, CRC checker, demodulator, and signal strength indicator. Each transmit and receive PN code generator consists of two 11-bit PN generators, allowing selection of an "A" code, a "B" code, or a "Gold code" combination of the "A" and "B" codes.

AMI's SX043 uses separate transmit and receive 64 MHz VCO's, which allows fully independent transmit and receive operations.

AMI's SX043 Spread Spectrum Transceiver interfaces to a generic microprocessor bus for programming and data transfer, and to an IF modulator/demodulator and RF radio for the transmission medium. 8530 SCC operation and HDLC protocol are emulated for the message packetization and error checking. No packetization can also be selected for data to be transmitted as received from the host.

The SX043 is a high performance part, capable of chipping rates up to 64 Mchips/second in transmit and receive modes. This results in a maximum data rate of 2 Mbps using QPSK or DQPSK modulation and a PN code length of 63. At lower chipping rates, the IC is capable of generating code lengths up to 2047 chips. The lowest possible chipping rate is 300 Hz. The flexibility of the design allows an optimal combination of transmitted power, system process gain, system bandwidth and bit rate in order to achieve a reliable communication channel with minimum interference to other adjacent channel or co-channel users.

Table 1: Pin Descriptions

PIN NAMETYPEFUNCTION

AGND1Analog GND

GND1ground

VDD1Vdd

OSC1inputCrystal Oscillator or external reference input. This input is divided by OSCDIV to generate the reference clock for the transmit PLL.

OSC2padoscXtal Osc output.

PLL[3:0]outputOff-Chip PLL programming; bit0, Enable1; bit1, Sclk, bit2, Enable0, bit3, Sdata.

TXD0outputTransmit data "I" output.

TXD1outputTransmit data "Q" output, or QAM output clock.

EPOCH1outputTransmit PN Generator Epoch Signal. (68 PIN PLCC PACKAGE ONLY)

PN1outputTransmit PN Generator output, can be internally disabled (PMR bit 4).

GND2ground

EXT[3:0]outputExternal Control port (lower bits), User Defined Functions for radio control.

VDD2Vdd

EXT [7:4]outputExternal Control port (upper bits), User Defined Function for radio control.

EXT[9:8]outputExternal Control port (upper bits), User Defined Functions for radio control. (68 PIN PLCC PACKAGE ONLY)

INToutputActive high. Initiates an interrupt to the microprocessor.

RESETinputActive low. Sets all registers to default values and forces AMI's WavePlex ICs into standby states.

CSinputActive low. Selects the chip for reading and writing via the P interface.

RDinputActive low. Initiates a read operation via the P interface.

WRinputActive low. Initiates a write operation via the P interface.

GND3ground

DATA[7:0]BiDirectionP Interface data bus.

ADDR[6:0]inputP Interface address bus.

VDD3Vdd

GND4ground

DUMPoutputIntegrate & Dump Control logic output.

EPOCH2outputReceive PN Generator Epoch Signal. (68 PIN PLCC PACKAGE ONLY)

PN2outputReceive PN Generator output.

RCVRYBiDirectionClock recovery input for Narrow Band Mode. Track-On (active high) output for Spread Spectrum Mode. Indicates to external circuitry that the MODEL SX043 is locked and tracking the received PN code.

TESTinputPin for manufacturing test only. Should be tied to ground for normal operation.

RXD1Analog I/OReceive data input 'Q' or QAM mode output clock to external shift register.

RXD0Analog InReceive data input 'I'.

VREFDAnalog InReference voltage for integrate and dump comparators and switches.

AGND2Analog GND

VCO2Analog InputReceive VCO control voltage input.

AVDD2Analog VDD

DACOUT1Analog OutputReceive DAC output during TRACK operation. Note: DACOUT0 and DACOUT1 are provided in the event separate gain control is necessary for SLIP and TRACK operation.

DACOUT0Analog OutputReceive PLL DAC output during SLIP operation.

RBIASAnalog InputCurrent reference for DACs and analog buffers. Nominal resistor value of 20K ohm to AGND3.

VREFAnalog InputReference voltage for ADC and DACs. Value is mid-scale between VDD and GND.

AGND3Analog GND

RSSI1Analog InputAnalog input to the ADC. Received Signal Strength Indicator from the RF receiver. Range is zero to VREF (full scale on internal ADC).

RSSI2Analog InputAnalog input to the ADC. Received Signal Strength Indicator from the RF receiver. Range is zero to VREF (full scale on internal ADC).This input is not usable in "Slip" mode.

AVDD3Analog VDD

AVDD1Analog VDD

VCO1Analog I/OTransmit VCO voltage control input.

> intended!), True?

It would be up to the inventor, but he could liscense it in such a way that commercial venturists would have to pay to liscense it, and amateurs using it for personal hobby uses, could easily obtain it freely. I expect its completely software anyway and would work with any dsp powerful enough to run it. Here is how they do digital recovery in many cell stations:

1) Sample the signal after the IF (the 10MHz signal)

2) Use an array of DSPs and do a FFT

3) Use any algorithm you need after that to use the frequency data to recover transmitted data.

So with this design, it is relatively easy to upgade the system via software, so if you figure out a way to prevent problems possibly caused by multipath, you just load it in later.

Later,

Isn't implementing the power limiting device that the ARRL suggested to the FCC, and that the FCC chose to write into the rules, going to be limiting factor in using commercial spread spectrum technology? It just seems like something complicated added to the requirements by ARRL at the last moment. Anybody here know enough about spread spectrum to explain how a commercial chip can have this feature added? It seems like there are many chipsets that do the modem and works on the market but that ones having this feature are all but non-existant. Maybe I am not reading the chip specs correctly?

Thanks,

>Take your jealous sarcasm and go home, toad.

Of course we all know that very advanced data communication techniques have
been developed and are in use in the professional telecom world, but that
does not do us much good when the technology is not available to radio
amateurs, either in the form of affordable ready-made equipment or in the
form of a design that the average home-constructor can reproduce.

A patent, even when licensed, is usually very far from that.

FREE - BRAND NEW Macintosh HAM TEST SIMULATORS

Upgrade Fast!

S I M U L A T E the test and get S T I M U L A T E D!

Studying for the ham tests and have access to an Mac? If it runs System 7.XX
and has 4 Meg or more of memory, you're in business with WD1V's Ham Test
Simulators, Morse Programs, Ham Radio.FAQ, and superb "how to study" material.

The newest Macintosh Ham Test Simulators are HERE (and THERE if you can FTP)!

WWW http://www.mv.com/ipusers/wd1v

Or you may obtain a version "6" Ham Test Simulator by mailing me a *FORMATTED
disk HD disk (1.4 M) and include a Self Addressed and Stamped disk mailer for
the return. Specify the test you need.

Simulator Name Version Valid Until

Advanced Ham Test 6.0 June 30, 1998
Extra Ham Test 6.0 June 30, 2000
General Ham Test 6.0 June 30, 1998
Novice Ham Test 6.0 June 30, 1997
Technician Ham Test 6.0 June 30, 1997

Your comments and suggestions for future versions are always welcome.

ATTN: PC and other platform users:
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
My Home Page also links to sites that offer live ham test simulations right
over the net - plus links to Ham Radio.FAQ and VE session schedules.

Good luck with YOUR next test!

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

There is an informal group of amateur radio operators that use Macintosh computers called "Macnet" with > 800 members world-wide.

We stay in touch with each other via packet & Internet and we have a HyperCard stack that tells the story of each of us called "Macnet Roster" that list

o CALL SIGN @ HOME PBBS
o FULL NAME
o Street ADDRESS
o CITY, STATE, ZIP
o INTERNET ADDRESS
o MACS USED
o RADIOS USED
o SOFTWARE USED
o PASSIONS
o COMMENTS

Macnet members can then communicate with one another directly or use our Macnet Moderated Mailing List to pose comments or questions to all of us on the Net.

To join Macnet, put YOUR INFO (via EMAIL or via disk using TEACH TEXT on a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER").

Or connect to our home page via the WWW http://www.mv.com/ipusers/wd1v

-------<sent to all new Macnet Subscribers & Macnet Roster Updates>---------

Welcome to Macnet!

A trip to my home page also reveals there are many superb files and programs for amateur radio operators that want to use Mac computers. See more details in January 1997 QST, page 100. http://www.mv.com/ipusers/wd1v/

* Ham Radio Test Simulators - where you can go from Novice to Extra Class practicing the actual tests right on your Mac! Check out the info on the new NO CODE license or scramble your neurons and learn Morse on the Mac too!

* Macnet Email Reflector - send an Email to all Macnet users on the Internet.

* Macnet Roster - a virtual "Who's Who" HyperCard stack with > 800 entries giving the names, addresses, phone numbers, of radio operators all over the world that are using Macs. Check out their projects and

their passions and put a design on your Mac Radio future. See what neat things are being done with Macs and Ham Radio!

* Mac Ham Radio Software Listing - as the name implies, its "The List" of the latest - much of it with FTP links so what you see is what you can get your new programs with just a click.

* Ham Radio.FAQ - compiled on a Mac with a lots of links to great Mac FTP sites for radio, electronic engineering, and similar data.

What did you use for the MAXFRAME parameter ?

A few years ago, I made some simulations about full duplex AX.25
links, assuming that user data is moving in both directions. I came to
the conclusion that 4 unacknowledged frames should be enough to keep
both directions fully occupied, if all frames are about the same size.
With a mix of frames with wildly different sizes indicated that
increasing the number of unacknowledged frames to 7 showed some
improvement in some situations. Did you notice a similar behavior in
practice ?

Alexander Kurpiers (kurpiers@zeus.uet.e-technik.th-darmstadt.de) wrote:

: We have done that for our 6cm links here. The transceivers used are
: similar to gunnplexers (we use the TX as LO for the the receiver). By
: applying the modulation to the 2nd LO. This works perfectly well at
: 100kB/s (we are currently limited to this rather slow speed due to the
: digipeater hardware - that's all an old fashioned 6809 can handle ;-))
: We only have 500 kHz wide channels on 6cm anyway...
: And I don't see the point with the bandwidth being twice as usual. The
: only bandwidth expansion that will occur is between the 1st mixer and
: the 2nd mixer. The narrow band filter comes in the 2nd IF anyway (at
: least in our receiver) so this is no problem. As nothing needs to be
: changed in the RF part of the transceiver I don't understand why the
: modulation index needs to be increased. The only problem that had to be
: solved was a very slow PLL for the 2nd LO to be able to modulate it.

I'm glad to hear that someone has successfully implemented this LO cancellation technique. If the two modulations can be held to approximately cancel you are correct that there should be no other real penalty. My comment about doubling bandwidth came from writing too quickly and confusing this with another topic.

Don't apologize for being limited by the capacity of the digital hardware. We have *constantly* been in that mode; from originally pushing TNC2 clones to 38.4 kbps to the internal clock recovery limitation of PI cards at 230 kbps. This is probably a good enough reason for using modified Ethernet cards, though I don't know about the legality of that protocol over RF in all situations.

My comment about FDX vs. simplex was intended to point out the relative ease (admittedly at the cost of increased bandwidth) of changing simplex RF hardware speed.

: At least for AX25 full duplex operation more than doubles the
: throughput. And we still think the AX25 L2 virtual circuit is by far the
: best solution for TCP/IP.
: And doubling the data rate implies using two times the bandwidth. Maybe
: in W this is no big deal in DL it is. The only band where we have 5 MHz
: wide channels for packet radio is currently 10 GHz. On all the other
: bands (we do not have 900 MHz here) the bandwidth is limited to 50 kHz
: or 500 kHz.
: Maybe spread spectrum really is a possible solution....

Another poster asked about ax25 MAXFRAME and I can't comment as we always ran tcp/ip on AX25 UI frames and let that protocol deal with outstanding frames by effectively setting it to 1. The results were

very good though. At 230 kbps an FTP of a large file can be accomplished at ~70% of the raw channel capacity and faster than that if RAM disk is used rather than hard disk. At that speed, the limitations are largely due to the computer hardware (a 386 DX/40 in this case). When turned down to 56Kbps we've seen over 80% of the raw data rate in FTP transfers. I don't think that AX25 virtual circuits would do any better though it might be close. I've never found running VC to help much and sometimes it hinders a lot.

I'm sympathetic of your bandwidth restrictions, particularly at microwave. It seems silly considering antenna directivities but I suppose we have endured silly laws here in the US too.

In general, as Shannon indicates, lots of bandwidth is a good thing for economical information transfer. It's also vital for combatting multipath which is the major nemesis, next to non-line-of-sight paths, of high rate data transfer over radio.

Since I didn't post it earlier, below my signature is the URL for the Higher Speed Packet Pages.

Can someone tell me if Kantronics has an e-mail address?

I am trying to get information on running K-Net on a KPC-4.
Thanks in advance.

We are the GNU super generation. Go to linux. Never pay a dime. Run it on your 386/16MHz with 4 megs ram (hell, we have been running a wormhole on one for a year)

Yes. Kill microsoft. Defiently not me!

>for Computers.

Well by far the cheapest solution (but not many people seem to take it) is
simply to use one 386 for each task. Or you could simply install linux onto
that 386 and do all 30 tasks at once.

Looking at the prices of things right now I really can't see how 286 are
selling at hamfest for $45. Lets see:

Pentium Pro motherboard: $100
Pentium Pro 150: $145
16 Megs ram: $ 55
1 gig hd: $45

Total: $ 345

Anyhow that is just my babling.

I'd expect the UI method to work better. While playing with TCP
through a TCP/IP tunnel I found that the interaction between timers
was terrible and caused throughput to be greatly reduced. This
may have been because the the TCP implementations were identical,
don't know.

At the time this occured, it did travel to Namibia.
That is why we were asked to help.

You can form your own opinions on the motives of TAPR.

Seems like the Namibia thing actually DID happen.
Anyone who does understand how internet email worked at
the time will understand why we were asked to help.

And of course you avoid the point of that discussion, which
was WHY we failed to cooperate and assist when we were asked.

Check out XPWIN also... but both the GOLD programs and XPWIN are the
very best in the opinion of most folks... Cost about the same as I
recall..

If your comfortable with DOS based programs go with Gold... it does work
in a Windows environmemt also .. but not full screen.

If you would rather work in a Windows environment with the Windows
protocols, etc... go with XPWIN..

My opinion ...

<probably not enough, but quite a bit of snippage occurred.>

Glen Quarnstrom (glenq@cyberhighway.net, WB7DOW @ KB7CFD.ID.USA.NOAM)
wrote:
> This paragraph misses the whole point. Packet networks have
> collapsed, not because of inherent flaws in technology, but because of
> apathy and lack of cooperation among hams.

The "packet networks" have died / are dying a natural death, in my
opinion. VE3JF posted a great response to the general thread of "woe is
the packet network, bad, BAD TAPR". Here's my particular put on this
thread.

1200 baud isn't inherently bad, or horribly slow. It's just usually
implemented incredibly badly- to the point it's amazing that it works at
all! Newcomers to packet are told to "just connect it up to your voice
radio and it will work. Not true! To communicate effectively, you need
a decent S/N ratio, you need other users of the channel to know when
you're there (Data Carrier Detect) so their transmissions don't collide
with yours, and you need decent Transmit/receive turnaround time- use
"True DCD circuits, not the squelch on your radio. Hint about "doing it
right"- build a bit regenerating repeater- it works really, REALLY
well! As for BBS forwarding and Net/ROM... all I can say is Yuk! To
>ME<, those systems are not effective, reliliable, or interesting. So.. to the charge that
I could make it better, but choose not to... I'm quite guilty.

9600 baud is a lot more fun. It's fast enough, and fits into a
"standard" repeater channel (another hint- to "do it right", build a bit
regen 9600 baud repeater).

What I choose to do with 9600 baud is to apply TCP/IP to it and use
"fun/cool/gee whiz" stuff that I personally find interesting. Instead
of using BBS', the Puget Sound TCP/IP Group that I'm involved with
chooses to use a Linux box running Majordomo- an e-mail list server.
Instead of Net/ROM or other Amateur Radio protocols, we're using Linux
boxes to route TCP/IP between LANs. For linking between geographic
areas, we use IP encapsulation over the Internet instead of HF. Instead
of simplex 1200 baud "LANs", we use bit regen repeaters, both wide area
and local. It's FUN, and we all learn a lot.

> New technology may cause a
> burst of new activity, but once the novelty has worn off and the grunt

> in packet, which is unique among ham radio sub-hobbies in that it

> *requires* cooperation and trust among hams in order to work. This
> chain is only as strong as its weakest link, unlike almost any other
> activity in ham radio.

Newer technology such as Spread Spectrum will change things a lot. One of TAPR's aims for an Amateur SS radio is to have networking built-in- probably TCP/IP. SS is sufficiently interesting, and there's enough difference between what Amateurs can do with RF, and what you can't do with part 15 devices that the technically curious will might well get interested in Amateur Radio solely to play with cool RF networking. I doubt you'll be welcome to poke around a Metricom Ricochet wireless TCP/IP network, but I plan to learn a lot putting Spread Spectrum and high speed (772 Kbps!) "narrowband" systems up and connecting them to the Internet using things like IPV6 and mobile IP.

> This was all very interesting, but it does NOT address the issue I
> raised in my original post. I still have a few questions.
>
> - Why do I not see the TAPR side of this controversy in *packet radio*
> bulletins?

Mostly because most of the "doers" at TAPR consider *packet radio* bulletins to be pretty much irrelevant. Great phrase swiped and modified from a Star Trek movie: "Amateur Packet Radio Bulletin Board Systems? Oh... How quaint.") I'm replying to this thread on r.r.a.d.m. because it's not terribly painful to do so and my post addresses an audience that I consider relevant. I simply wouldn't bother on a PBBS. If someone cares to port this message to a PBBS... fine with me, but it's probably too long for a PBBS message, I didn't put hard C/R's in between 70 and 80 characters, and because I used mixed case it probably looks crappy on a Commodore 64. The last time I looked at a "BBS", I was apalled that the user interface (and that's being charitable) hadn't changed in the 3 or so years since my previous look. There's only so many hours in the day.

> - Is there any truth to the many accusations that TAPR is promoting
> use of the Internet as a linking method, to the detriment of the
> existing ham RF links?

Not to the deliberate detriment of any other linking method- use whatever works and makes sense for the particular application. If creating such a link "causes" problems with "existing ham RF links", that's "Evolution In Action". What TAPR has said (my intrepretation) is that it's OK to use non-Amateur linking- a mux port on a cross-country fiber, some unused time on a geostationary satellite, and yes, tunneling through the Internet to link Amateur Radio systems. Sometimes you can't (sometimes due to expense, lack of sites, lack of manpower, any NUMBER of reasons) can't use Amateur Radio exclusively. That's OK.

In my opinion, the Internet is a bigger draw than Amateur Radio. Most of the Amateur Radio "content" is boring... for sale or swap, medical problems, DX, contesting. The Internet by contrast is fascinating.

It's easy enough to connect via modem, or just use it at work. But, more fun to me is to try to connect to it via radio... that's INTERESTING to me, and what keeps me in Amateur Radio. Put another way, I'm more interested in doing networking by using Amateur Radio than doing "Amateur Radio Networking". As far as I can tell, my use of Amateur Radio is a legitimate one.

> - Why has Hank Oredson W0RLI been banned from TAPR discussion groups?

Those who administer the various TAPR mailing lists, and the TAPR Board of Directors chose to not allow certain individuals to participate in TAPR's mailing lists due to their previous behavior on TAPR's mailing lists. TAPR's list server is paid for by TAPR members and operated by TAPR members. It's basically a private facility that TAPR chooses to make available to anyone who doesn't abuse (solely TAPR's opinion) the privilege of using TAPR's mailing lists.

Disclaimers:
I'm chair of TAPR's Networking Special Interest Group (TAPR's NetSIG mailing list), and TAPR Secretary, and proud to be so.

No need for fancy FFTs and expensive Sound Cards. All that you need is
an analog comparator with some histeresis to convert the audio signal
of your receiver into a square wave. Feed this to one of your computer
ports (parallel or serial) and from here on is all software. Depending
how good a programmer you are, a CW decoder piece of software can be
written, in a week or so.

Have fun

no need to do the hard reset......
i have an "old indian trick" i use to do this..... while in
KaGold...simply hit alt F-3 to enter teminal mode..... after verifying
you are in terminal mode...(you'll see the familiar cmd: prompt after
hitting the enter key a couple of times) simply turn off the tnc...
then do a alt F-3 to exit terminal mode.... kagold will realize the
tnc is no longer "alive" and will ask for a alt-F-10 to terminate...
then turn your tnc back on and run your other packet program....here
is a command list

1. while in kagold hit alt F-3
2. turn off tnc
3. hit alt F-3 again
4. hit alt F-10 to terminate
5. turn on tnc
6. run your other program

no sweat getting back into the tnc with kagold.....it automatically
puts tnc back into host mode....

> inexpensive motion detector oscillators probably will not be able to
> provide, at least at higher data rates.

We have done that for our 6cm links here. The transceivers used are
similar to gunnplexers (we use the TX as LO for the the receiver). By
applying the modulation to the 2nd LO. This works perfectly well at
100kB/s (we are currently limited to this rather slow speed due to the
digipeater hardware - that's all an old fashioned 6809 can handle ;-))
We only have 500 kHz wide channels on 6cm anyway...
And I don't see the point with the bandwidth being twice as usual. The
only bandwidth expansion that will occur is between the 1st mixer and
the 2nd mixer. The narrow band filter comes in the 2nd IF anyway (at
least in our receiver) so this is no problem. As nothing needs to be
changed in the RF part of the transceiver I don't understand why the
modulation index needs to be increased. The only problem that had to be
solved was a very slow PLL for the 2nd LO to be able to modulate it.

> seemed to work OK. Full duplex in RF hardware often requires more
> effort than doubling (or quadrupling) the data rate of a simplex link.

At least for AX25 full duplex operation more than doubles the
throughput. And we still think the AX25 L2 virtual circuit is by far the
best solution for TCP/IP.
And doubling the data rate implies using two times the bandwidth. Maybe
in W this is no big deal in DL it is. The only band where we have 5 MHz
wide channels for packet radio is currently 10 GHz. On all the other
bands (we do not have 900 MHz here) the bandwidth is limited to 50 kHz
or 500 kHz.
Maybe spread spectrum really is a possible solution....
BTW there is a very interesting chip from Stanford Telecom that does all
the things needed for a DS-SS system (only a fast DAC needed).

This has been true for amateur radio voice communication when compared to the
telephony network for at least 40 years. But nobody (at least not hams)
compares it that way.

Another problem is that US amateurs often think that "all the USA" is
equal to "the whole world"...

>One of the best services someone could do for the packet community
>would be to write a simple filter that would immediately kill any message
>to ALLUS that contained the phrase "For Sale."

Of course these filters have existed for years. Sometimes they work,
usually they won't because the next guy will put "Will sell:" above
the message.

2828. Use a static domain name to refer to your dynamic IP address!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-05-29 00:00:00 UTC
From: Stephan Edelman <stephan@dynip.com>
Message-ID: <338E4835.2681@dynip.com>
Source record: 29663

Hello All:

Finally, you can refer to your machine by means of a static domain
name that constantly resolves to your current dynamic IP address
every single time that you are connected to the Internet! Now,
you can run your own packet radio gateway, web server, FTP server, chat
servers, etc. and people will never have to hunt for your current
dynamic IP address again! Other people can access your available
servers and services by simply specifying your static domain name in
any existing Internet application without modification, because
your static domain name is seemlessly integrated into the
existing Domain Name System (DNS) on the Internet!

You can get your own personalized sub-domain within minutes
of running the client software. You can try out the service
free of any charges for 30 days! The client software is
available for Win 3.X (16-bit) and Win 95/NT (32-bit) platforms.
We are in the process of creating FreeBSD and Linux versions
as well as a Mac OS 7.X version. Visit our site at
http://www.dynip.com and give it a try!

Best Regards,

Stephan.

None is an incorrect statement.

There were actually numerous notable successes- TAPR's true DCD kits have sold decently and inspired the TNC manufacturers to include a true DCD function in their kits. 9600 baud packet was originally "just an idea" by K9NG. The WA4DSY modem pushed state of the art when it was introduced (and the basic design is capable of substantially more). The Slovenian 13cm >1Mbps radios published in the 1997 DCC Proceedings are real and in daily use in Slovenia.

Much of the point of the DCC articles is to share wild-assed ideas with other Amateurs. There are numerous cases of someone becoming inspired by something they read and coming up with better, faster, cheaper ways to to it.

> When the Japanese came in with "data" on their voice rigs cover, and it turned

> fiction. Most of just continue to use our Tekk and KPC-9612...

The Tekks, the MFJ crystal VHF and UHF radios, and the Azden PCS-9600D are the "packet radios" that everyone said they wanted. Small, fast, easily interfaced, simple, and best of all CHEAP!!! (except the PCS-9600D). Someone with less to lose than the ARRL needs to get their hands on all the "9600 baud capable" radios and do a comprehensive test, say against a PCS-9600D and report the results widely. That would flush 'em out. TAPR has a lot to lose from such a comparison, so it's not appropriate to ask them to get involved either.

> TAPR's Spread Spectrum endeavor is in line to follow the packetRadio into

> wants to manufacture it (Kantronics, PacComm, etc, etc).

TAPR's very much aware of those and many other issues that are factors of
the ultimate success of an Amateur SS radio. As you point out, they've
been down this path before with the PacketRadio, the NNC, and several
other projects. It's been a very painful education process to discover
what works and what doesn't with a completely volunteer labor force whose
skills are in demand and well compensated, and then turn the kit loose in
the Amateur population. Some of TAPR's hard won knowlege in this area is
very surprising, and there's no way they could have obtained it except by
doing it the hard way of releasing kits and seeing what kind of acceptance
they get, and how many actually get built (to a working state) and put to
use.

> ooph. I thought I was going to get a radio design... Damn. :-)

Providing services which are not available on the internet is a tough one.
To do this, we need to capitalize on the fact that this is radio, so it allows
mobility. APRS is not exactly a profound application of packet radio, but it
is attracting a lot of attention because it *is* one of those applications
that offers something different from the standard internet apps. We need to
take the next step, combining mobility with higher data rates, and then see
what new applications can emerge from that.

>A good acid test may be whether there has been a growth or decline in

The gateway was a definite spur to growth here. As in most areas, there has
been some recent decline as the novelty wore off and faster/cheaper internet
access became available, but I'm convinced that the level of activity is still
much higher than it would have been had the gateway not existed. In addition,
a high percentage of the packet users here use TCP/IP, motivated by the
gateway and internet-type services which have existed here for many years.

KAGOLD uses the TNC in the host mode. I don't know what version your friend is
using, but I use KAGOLD and it is configured to take the TNC out of the host
mode when it's done, so any other software works fine when KAGOLD exits.
Tell your friend to go into SETUP, then pick COMMUNICATIONS and there is
an option to put the TNC back into COMMAND mode when the program exits.
Your friend is leaving his TNC in host mode........

>I have an older KAM with the Enhancement board. I noticed that you were
>using KAGOLD. I've been using HOSTMASTER2+ and was just wondering how
>KAGOLD compared to HM2+?

Like comparing a mud pie to a Boston creme pie..... Hostmaster is probably one
of the worst TNC programs available. KAGOLD is the best one I've seen.

Make money selling stupid stuff on the Net (Great for Teenagers)

Hey there are ways to do it, In my 5 page book, ill give you all the locations on the net to sell stuff that costs you nothing. Ill give you all the address's to online auction house's, Newsgroups to post to, and all the rules in the game. Hey you wont make a million bucks, but you sure as hell can increase your income by about 200-500 dollars a week, Spending only 5-6 hrs a week at the computer. And who wouldnt mind that.

For "How to make cash on the Net"

Send $5.00 cash and an empty SASE to:

Make Cash
PO Box 26
Edgewater MD 21037-0026

Not responsible for lost or misguided orders. Please allow 2 weeks for delivery, Rush orders add $3.00 for priority mail. No Checks accepted, Cah only. Make Money, Relax!

Depends on the packet loss rate at the RF links. Consider 2%
packet loss rate at one RF link, and consider a path
over 20 RF links (not uncommon these days in central europe),
then the path packet loss will already be 33%, the point
where TCP retrans start to get extremely slow. It does make
sense to do retransmissions per RF link if necessary, and the
method we have currently is AX.25 VC.

>much and sometimes it hinders a lot.

The Germans strongly believe in hop-by-hop acknowledgement, i.e. the loss
of a frame on a single link in a multi-hop TCP connection should be recovered
by retransmission on that single link, not by the endpoints (TCP).
When the link quality is less than optimal, this certainly has advantages.
When the link is very good, the overhead of the AX.25 connection starts to
come into play, and UI mode is better.

I have solved this problem in the Dutch network by measuring the link
quality of the links in both directions independently (using UI frames
with sequence numbers, that are mapped by the other side to produce a
"percentage of test frames received OK" figure averaged over several
time periods).
The transmission mode of IP frames is then automatically switched between
UI and VC mode based upon this measurement. When the link quality is
above a certain threshold, UI mode is used. Two thresholds are used, one
for relatively short frames (acks and small data frames), the other for
"full size" frames. This is done because the quality of a link tends to
be better for shorter frames (because of the lower chance of a frame CRC
error for a certain BER).
This solution provides the best of both worlds, without requiring the
attention of the sysop all the time.

A paper about the link quality measurement protocol has been in the works
for much too long, I really ought to finish and publish this because it
works very well. (it is much more useful than measuring ping-pong frame
roundtriptimes, IMHO)

> I'm sympathetic of your bandwidth restrictions, particularly at
>microwave. It seems silly considering antenna directivities but I
>suppose we have endured silly laws here in the US too.

Please don't judge too quickly... in the European network, even with reasonably directive antennas we really need 20 different channels for link operation. Try to get a map of the western-European network, and compare it to what is operational in the US. You will be amazed.
There are several nodes that have more than 10 links to other nodes and application systems.

When we then look at the microwave allocations, and subtract the band parts that cannot be used for data (there are other modes as well, and most bands are secondary and are swamped with radar), one simply cannot afford to allocate a few MHz to every link, at least not below 10 GHz.

>You can form your own opinions on the motives of TAPR.

>Seems like the Namibia thing actually DID happen.
>Anyone who does understand how internet email worked at
>the time will understand why we were asked to help.

Of course it could have been fixed by the Internet people. Even when
the mail was still travelling over UUCP. They could have added a couple
of MX records that would have directed the *.usa.na and other .na names
that exist on amateur radio but not in Namibia to a server which was
directly on the Internet (somewhere in the USA), and would have bounced
such mail.

But, they would probably have seen that as "a crude hack" and instead
decided to pass the bill to the radio amateurs, who needed to do much
more to solve "the problem" on their side. We should have reported
that difficulty, and the Internet people probably would have been reasonable
enough to accept it and go ahead with a solution on their side.

Instead, we decided to go ahead with the change even when there was a
lot of opposition, wasting a lot of time and effort because it could never
be a success. Apparently, the Internet people were wiser and have fixed
it on their side in the meantime.

>> the hostname doesn't exist. The mail never travels to Namibia, and the
>> error message is generated by the local mailserver.

>At the time this occured, it did travel to Namibia.
>That is why we were asked to help.

So now you know once and for all that it is no longer true, and that you
don't need to include this reason for change from .na to .noam in your
bulletins about this topic on the BBS network.

Maybe a rectfication of the bulletin that was sent about this topic a
few weeks ago would be in order as well, as there apparently has been a
lot of confusion about this in the amateur radio world.

Not all sysops have access to the Internet, and even fewer know what is
really going on when a message on Internet is delivered. But I presume
you have the knowledge, and you could have done a few simple nslookup
operations to validate that it is still true.

Well, fine. We now know that it is no longer true, that there is no reason
anymore to change from .na to .noam, so you can simply rollback the change
and everybody will be very happy.

>> However, Hank continues and continues to advocate this reason for changing to
>> .noam addresses. It gets boring and irritating.
>> (besides, he tries to convince us Europeans that just because he changed
>> .na to .noam, we somehow have to change .eu to .euro! that is even sillier)

>I advocate no such thing.

I do know that it was invented by Tom. But (although I have no filed
copies of earlier discussions) I think you have always taken his side in
the heated debate.

In my opinion, and apparently in the opinion of many sysops, it is a
silly proposal. Using 4 letters for a continent designator, where 2

letters is entirely adequate and even 1 letter would be enough, is just a waste. The Internet even uses only 2 letters for a country, where the BBS network uses 3.

Before, changes were even made to the hierarchical address system to coverup bugs in the software (the infamous # sign which was only there to please the parser that incorrectly tried to match individual address components, instead of whole area names anchored to the end of the address).

Let's not again make the same error of changing the address system instead of the component that introduced a problem. Heck, the component already has been fixed (by the introduction of a DNS server serving the .na domain and not providing a simple MX for *.na or something like that), so there is no need for a fix anymore.

There is a program called Wxsat that will take
the audio from a scanner receiving a NOAA satellite
or a Russian weather satellite and uses the Soundblaster
card to perform the decoding functions.
There are several programs for Win95 that use the
soundblaster for sending and receiving SSTV.
I found a program that can monitor 1200 baud packet
using the Soundblaster and *no* TNC, but would like
to find a program that will also send the packet data
to the transmitter and has a built-in terminal program.
Does such a program exist? How about for PSK packet?

I didn't mean to be judgemental but sympathetic of a circumstance where
getting adequate channel size was a problem, for any reason. The
physics of information transfer versus channel capacity are greatly in
favor of wide channels and few bits/symbol. Any manmade restriction on
this seems a shame. It seems that what you describe is mainly that.

However, at microwave, there is so much more room and especially so
much better directivity that anything other than an artificial
constraint seems pretty unlikely. For example, at 10 GHz, it is
possible to get enough antenna isolation even with antennas located on
the same tower and running directivity in only one plane, that an
on-channel repeater is possible. A group of microwave enthusiasts in
San Diego, Calif are doing just that. We are doing the same thing at
900 MHz here as well. see my OCAR pages at
http://www.tapr.org/~n6gn/ocar/ocar.html for details of both.

I don't know what your spectrum allocation is there at 10 GHz but the
US has 500 MHz shared with the government. Even at 10 MHz/channel this
is a tremendous amount of room and combined with the channel reuse that
is possible with antenna directivity it is probably all US amateurs
could use in the forseeable future, were it harnassed properly.
I suspect that the same could be said of several of the lower
microwave bands as well.

We have radar too but it isn't an insurmountable problem. The duty
cycle is short enough that appropriate coding and error correction can
overcome it.

I agree fully with Barry on this one (surprise). While many in our hobby
seem to be focused on building new and faster switches (i.e. computers),
the key is radios.

Radios have always been the issue and for the most part we (amateur
radio) have just found work arounds to the issue of using them with data
modes. Pete Eaton in 1988 was on the right track within TAPR when he got
the packetRadio project going. Unfortunately, there was just a lack of
focus on getting the project completed. It had all the right elements
though. You could tell from the amount of interest the project had when
first introduced. If it had been pulled off and was reproducable, then I
think we would have many more people operating 9600 baud packet radio and

no telling what that could have led to.

1200 baud packet radio is popular because it can work with most every radio found in the ham shack. Amateur radio operators wanted to go faster, but as interfacing to the radio required a higher expertise, test equipment, and for 9600 baud or faster speeds you can track a lack of interest or doing in implementing the technology in operational settings. TAPR only produces about 150 9600 baud modem kits a year and I would think the 56K DSY modems are less than that. Compare that to the number of TNC-2 _still_ sold and we can see that if the user can't get the radio to work easily then the mode is doomed to failure.

One reason APRS is successful is again because operators can use their HT's or car radios with no trouble. The same reason packet radio was a success to begin with -- ease of technology integration. We have to have new technology that provides the faster speeds and better access the digital aspect of the hobby seems to require now, but still provides ease of integration with the RF side. This is going to mean that the Radio and Data segments have to be designed and integrated together, since most amateurs seem to not want to deal with the integration issues -- whether it be 1) they can't get the equipment, 2) don't have the necessary test equipment, 3) don't think they have the time, 4) are intimidated by the technology, or 5) any of a number of other reasons.

While Spread Spectrum might not be the perfect answer, it is what I see as a bright possibility to solve many of the issues this thread is about. If anything, look at the stirring of learning and education about the mode from those for and against. If anything, TAPR has fulfilled it roles as an educational group by at least getting people to think and look at some of the elements of this potential useful mode. If someone gets excited about what we are doing and goes out and does something else as a result -- we have completed our task as a group.

However, talk is cheap. I see a lot of talking and few doing on this thread and others (packet radio, Internet, etc). It is easy to sit around and say what is best for amateur radio or what mode should be used over others. However much someone dislikes what I am doing or what TAPR is doing -- it will come down to who does something about it. The rule is -- those of code/design rule. Look at the current BBS standard -- based on what Hank, W0RLI, first wrote. Although he has done little in the last several years on the software, what he set as a standard for a BBS interface and usage has remained. I can state many other cases that show that the first to implement and get adopted stays around for a long time. Talking has little impact at times on what the eventual outcome will be, since the designer or coder is doing it on their own time. It is sometime helpful to discuss things and communicate (which is the mainstay of this hobby) so others can understand what is happening -- but someone has to implement and that will happen no matter what daggers are thrown in any particular direction.

Cheers - Greg, WD5IVD

I totally agree with Jim, I have both HM+ and KaGold, and KaGold really
unlocks the power of the KAM on VHF and also the HF modes. You can also
log your contacts with KaGold, and the log file can be imported by other
logging software.
PkGold works just as well with the AEA TNC's (I have it for my PK-88)..

So other BBS users get the same choice as to what they read. Simple
concept, isn't it?

>One of the biggest "junk" problems with packet has always been that
>every twit with two fingers to type with seems to think that the whole
>world will die if they don't read their "I have a broken VIC-20 computer
>for sale" message, so they address it to "ALLUS" or something like that ...

Kinda like UseNet, isn't it? The answer is education and innovation,
not "censorship."

>One of the best services someone could do for the packet community
>would be to write a simple filter that would immediately kill any message
>to ALLUS that contained the phrase "For Sale."

One of the best services someone could do for the UseNet community
would be to write a simple filter that would immediately kill any
message to alt.radio.amateur.digital.misc that contained the phrase
"Carl R. Stevenson."

You can take any great idea published in the ARRL Digital Conference and put them in the "lack of focus" bin. I personally enjoyed the dreams, and loved the articles; it's just that everything was just an idea that died at the "building the breadboard" stage. None of it ever made it to commercial function.

When the Japanese came in with "data" on their voice rigs cover, and it turned out to be a lie, that pretty much nailed the coffin of "packet radio" shut. I don't even read the ARRL Digital Conference stuff anymore. Clancy writes better fiction. Most of just continue to use our Tekk and KPC-9612...

TAPR's Spread Spectrum endeavor is in line to follow the packetRadio into fame. There's just no focus. The last two Status Registers showed no more progress than the initial goal statement.

I think the focus is wrong. Hams are not going to build a high speed computer and Spread Spectrum radio on the bench. This bench device (if built) will never be brought to market. The way to get SS into Ham radio is to contract it out. TAPR would do well to take the money they are going to blow on Jim-Bob the Ham and have a design company kick out a high speed node and SS design using off the shelf products. Look at all the Telnet Servers out there, they all use the same chip (or family) just use a done design from 5 years ago. Grab the latest SS design, have it engineered, and sell the damn design to whoever wants to manufacture it (Kantronics, PacComm, etc, etc).

rob@pe1chl (Rob Janssen) writes:

> So now you know once and for all that it is no longer true, and that you
> don't need to include this reason for change from .na to .noam in your
> bulletins about this topic on the BBS network.

To be honest, I reckon that at the time, the move from na -> noam might
have been a good idea for stations that were AX25 pbbs and smtp capable.

Unless you have a fairly complete list of AX25 PBBS stations, and wish to
gateway messages from smtp to the AX25 PBBS system, you need some fairly
good rules about what is a valid PBBS address, or an smtp address that might
be temporarily or permanently unavailable.

AX25 BBS sysops are not going to be happy about trying to forward mail to say:
smit@windhoek.edu.na any more than jan is about wz9xxx@#swpa.pa.usa.na .....
should, of course, a *rewrite* line in a NOS point that way.

Hank's solution of changing the continent designator made life a lot
bit easier for stations gatewaying mail between amprnet smtp and AX25 BBS.
I think the four letter country code is reflected in a TAPR recommendation
too ??

The downside was seeing some amateurs over here bitterly complaining about
the .EURO addressed stuff, purely because they thought it was a yankee
inspired political thing just to show who was boss, and they couldn't
possibly grasp that there might be some people for whom life would be made
easier as a result !

> Well, fine. We now know that it is no longer true, that there is no reason
> anymore to change from .na to .noam, so you can simply rollback the change
> and everybody will be very happy.

Whilst some of the more well connected and knowledgable smtp <> PBBS gateways
might be able to respond to the change back, accidents might still occur
amongst mail gateways using more primitive methods of sorting amd rewriting.
All credit to Hank for doing his best to advocate as foolproof as system as
possible !

From: k5rov@worldnet.ATt.NET
Message-ID: <338E2C30.52C5@worldnet.att.net>
Source record: 29668

I have been a CW operator for over 50 years. However, bad arthritis now makes it difficult for me to use my key at the higher speeds. As a result, I often switch to my KAM, and use my computer as a keyboard. I find I can type CW when I have trouble sending on the paddles.

I have a second station which uses a Kantronics UTU instead of the KAM. The trouble is, I am a fast typist, and the UTU only has 32 characters of buffer. As a result, I have to slow down my typing, or lose some of the info.

I wonder if anyone has had any success increasing the memory of the UTU? Even doubling the memory size would be a big help. Any assistance would be appreciated.

Apparently I need to read the latest papers on these subjects. My
assumptions about header compression are primarily based on VJ compression,
which I studied for possible use on packet interlinks (and decided not
to implement because of the problems I described)

It would have been nice if you had an answer to our prayers.
Now, your information was just like the "spread spectrum" that often
rises its head in this group: everyone seems to know how good it is,
but nobody has been able to show a working system that could be used for
amateur radio purposes (i.e. affordable and/or reproducible). So, we
might as well forget about it, as far as the packet network is concerned.

It is very nice that these techniques exist, but our packets only flow
across those links that we can actually build.

Look at PC/FlexNet (http://home.pages.de/~flexnet).
No builtin terminal though, but you can plug standard
terminal programs (like GP, BCT, SP, TOP, or even WinGT) onto
it.

Anyone who likes stupid ideas could look at the following URL:
http://www.dreamnets.com/youtalk/index.html

BTW, I was listed on the counter as #1. Either this dolt can't write CGI scripts, or he isn't making 200-500 dollars a week on this scam!

Thanks for the URL. It doesn't seem to be working
right now. I have been there before and this is
not what I'm looking for. There are some soundblaster
drivers buried in a lot of other packet information, but
nothing useful for one wanting to use the soundblaster
to send and receive packet without having some sort of
other gadget attached to the radio and computer (TU, TNC,
Hamcom interface, Baycom adapter, etc).
I'm looking for something that functions similar to
PktMon or Wxsat to handle the tones through the soundblaster
DSP function to decode and send information. Maybe nothing
has been written to do this yet.

Either you weren't there recently enough, or you didn't look
thoroughly enough. Granted, it lets you use Baycom modems,
TNCs and so on, but it also lets you do what you want, if you chose
the right modules.

http://dl0td.afthd.th-darmstadt.de/~flexnet/soundmodem.html
is an intro into what you want.

(note: http://home.pages.de/~flexnet is a redirector to
http://dl0td.afthd.th-darmstadt.de/~flexnet)

> I'm looking for something that functions similar to
> PktMon or Wxsat to handle the tones through the soundblaster
> DSP function to decode and send information. Maybe nothing

Soundblaster has _no_ DSP. They call it 'digital sound processor'
and has nothing to do with 'digital signal processing', it's
merely an inferior A/D- D/A-converter.
ASP would be a DSP in the 'usual' sense, but it's neither documented
nor user programmable (most likely). So the DSP has to be done in
the main CPU.

And you will still need a tiny piece of hardware, to connect PTT
to the computer, be it a simple VOX circuit, or a single transistor
to connect the parallel or serial port to the PTT line.

Does anyone know of any "Sound Blaster" program that will "read"
the time code burried in the WWV 2.5/5/10/15/20MHz broadcasts?
While it is easy to get accurate time via the net, not all of
us have "net access" at home or in the feild. The NIST (used
to be NBS) has a nice web page that goes into some detail on
the format of the BCD code.

Hi all, it appears that I posted this as a "MIME" Base64 encoded file, so I will try again.

I still have a PC and some surplus components if any one is interested ?

Packard Bell Legend 316sx Spec :-
4Mb ram + 100Mb HDD + 3.5" 1.44Mb Floppy
Mouse + Keyboard + handbook (Dos 5 and some software loaded)
With VGA monitor £200 OVNO
or £120 OVNO with out the monitor.
would suit college / university student

Paccomm PC320 - PC TNC card for packet radio onboard modems for
300 & 1200 baud manual box and some disks £60 O.N.O
(fits in to the above pc for a complete packe radio setup EX-radios !)

other bits :-
2 off AMD 486 dx4 cpu's (tested and working @100Mhz)
one brand new £25 O.N.O.
one 1 year old £20 O.N.O. (both 3volt supply)
Cirrus Logic 5428 VLB (vesa) graphics card 1MB Ram £15 O.N.O.
(is boxed and has drivers disk)

16bit multi IO card (2HDD, 2FDD, 2SER, 1PAR, 1GAMES) £6 O.N.O.

8 x 1Mb (30 pin) Simms £40 O.N.O.

Email me if you need more information or want some item.

Cheers Martin

I wouldn't be surprised if, after spending money to obtain or produce specialized hardware for connecting to their radio rigs, if there aren't more than a few hams out there who are still using their old Commodore-64 computers in connection with the hobby.

I know that even in offices, some firms have hesitated to make the conversion to the new software. Many utility programs, like antivirus programs, need to be replaced. There's a learning curve, a loss of control over one's machine - I've found out how to configure Windows 95 to allow booting up into the previous version of DOS, by changing a file named MSDOS.SYS (a text file, having the same name as a _binary_ file in DOS) but this option isn't properly documented.

I would therefore think that there are quite a few people still using Windows 3.1. However, it's the people with the most money to spend who have hastened to run out and buy Windows '95, and it's those same people, perhaps, who will have the most money to buy your product ... and developing an extra version involves additional expenses. (What about getting a copy of C Set++, and making an OS/2 version, someone will ask...)

Probably your best bet is to release the Windows 95 version when it's ready - and then, based on feedback, if enough interest is expressed by people who would like to see a Win 3.1 version, use some of the money raised by the Windows 95 version to support the additional development effort.

I have this vague memory of seeing an ad for some program development product - I don't know if it was Visual Basic, but it could have been - where the more expensive Professional version let you produce a program that would run under Windows 3.1, but the standard version, considerably less pricey, limited you to Windows '95.

Glen replies:

>And completely irrelevant.

sigh

There are a number of hams who seem to be upset about the Internet, claiming that the Internet is killing off ham radio. I was listening to the Real Audio transcript of a session of the 1997 Open Ham Radio Town Meeting off of the TAPR web site the other day which tried to answer the question "Is the Internet killing Ham Radio?". You can listen to it yourself on:

http://www.tapr.org/tapr/html/townmeeting.97.html

This is certainly an issue which is charged with emotions, as you will hear when you listen to this transcript. One question was asked of the audience, which basically amounted to "do you spend more time on the Internet than on the radio?". When counts were taken, it seems that people were spending more time on the Internet than on the radio. This could certainly mean that the Internet is "killing" amateur radio.

But I tend to take a different view. This should serve as a wakeup call for the ham radio community. The fact that seemingly the majority of hams are using commercial data networks over the packet networks should make people ask why that is. I think the reason is obvious. The existing packet radio network just doesn't work that well. There are a number of reasons why, having to do with politics, economics and outdated technology. Let's face it, the commercial providers have given us cheap hardware (why does my 1200 baud tnc cost $120, when my 33.6K baud modem cost me $40?), cheap internet service (< $20 a month for unlimited access in most areas) and take care of all the headaches of maintaining sophisticated data networks? The question should be can the current packet network compete (I think the answer is no) and if not, then could it? I think the answer to this question is likely to be no as well, there are just too much work to do in maintaining a real data network.

Hello,

I wanted to use my ar8000 handheld receiver, for decoding
CW keyed data, with keying frequency nearby 5 kHz.

- where can be taken this signal from...
- could be used the FFC audio output (pin 2, before audio amp.) ?
- is the headphone socket adequate, (in this case), for decoding data ?

If I missed something, please let me know!
Thank you very much for the help and any information.

Best Regards,

WWW Message Board Experiment

Folks,

May I engage your services for an experiment...

As you know, I set up a "Personal Web Server" on my
home computer running Win95. Previously, the server
had only a copy of my web page...

But, now...

I have taken the mirror of my home page off and installed
an automated message/discussion group faility called aptly
"Short Circuits"...

Please go to my home page http://www.qsl.net/k7on and click
on the rotating arrow and while I'm connected you'll be then
connected to my personal server where you can access the messages
entered by you and others.

It is threaded and resembles a Usenet newsgroup, but will not
be spammed as it is not connected to the Internet by a static
IP address...(this is part of the experiment, BTW...)

Please give it a shot!

I'll be watching for messages on there and I've put 2 already myself.

73, Brian http://www.qsl.net/k7on

Rob ...

The old saw "build it and they will come" doesn't seem to hold in ham radio ... in ham radio it's more like "build it and they'll either just let it die on the vine, or they'll lynch it and its builder because it's not more of the same ..."

Unfortunately, most of today's hams seem to want to keep things exactly like they were "back in the good old days" ... and actively oppose anyting new and better ...

I don't know the rate at which PacComm is selling the 56 kb RF modem
(they did move a stack of them at Dayton), but back when we were selling
kits, we were moving substantially more than 150 a year. I also expect
that between PacComm and Kantronics, many more than 150 9600 baud
modems are moving per year too.

The big problem with 9600 is trying to coerce it to work through a voice
grade *synthesized* FM radio with modulation in the loop. The 56 kb RF
modem sidesteps that problem by integrating the radio into the modem.
You still need a transverter following it, but that's essentially plug and play
with the Microwave Modules and Down East Microwave transverters.

Use of the Tekk *data* radios can make 9600 nearly as plug and play. The
problem is that users want to press inappropriate radios into 9600 baud
service. And the Japanese manufacturers haven't helped by advertising
inappropriate radios as "9600 baud ready" when in fact they are not. Nor
have amateurs helped by offering "mods" to these inappropriate radios
which purport to make them 9600 baud compatible when in fact the problem
of modulation distortions caused by introducing the modulation into the PLL
remains unaddressed.

>One reason APRS is successful is again because operators can use their

>of integration with the RF side. This is going to mean that the Radio
>and Data segments have to be designed and integrated together,

The 56 kb RF modem already offers that. The design is field proven, and
it is available off the shelf W&T *today*. A 56 kb setup is comparable in
cost to a 1200 baud setup *including a new high end Japanese voice radio*.
It is the myth of dual use which makes 1200 baud look comparatively cheap.

But once you realize you need to dedicate a radio to packet, and *stay on
your assigned LAN channel 7x24 so the network can route mail and other
data traffic to you properly as and when needed*, that advantage evaporates.
The idea that you can just pop up on packet at random times and on random
channels has done more damage to packet than any other idea. Packet is
inherently about cooperative networking. And user stations are *part of the
network*. Random hit and run operation will never be satisfactory, and won't
ever allow effective networks to be established and maintained.

>since most
>amateurs seem to not want to deal with the integration issues -- whether
>it be 1) they can't get the equipment, 2) don't have the necessary test
>equipment, 3) don't think they have the time, 4) are intimidated by the
>technology, or 5) any of a number of other reasons.

Well, you've identified the primary 9600 baud problem. Amateurs *think* that they
want dual use from their FM voice radios. Of course those radios are *completely*
unsuitable for 9600 baud operation, and any serious packeteer is going to have to
dedicate a radio to packet anyway. Dual use just isn't a satisfactory solution, even
at 1200 baud.

That's the major point we need to be hammering home. We need to get amateurs
used to the idea that voice radios are for voice, and that one needs a *data* radio for
packet. Tekk data radios offer a cost effective solution for 9600 baud packet radios.
(Surplus Motorola and GE crystal controlled radios can be pressed into service too,
but some mods are still needed for them, so they aren't plug and play like the Tekk.)

>While Spread Spectrum might not be the perfect answer, it is what I see
>as a bright possibility to solve many of the issues this thread is about.
> If anything, look at the stirring of learning and education about the

>roles as an educational group by at least getting people to think and
>look at some of the elements of this potential useful mode. If someone
>gets excited about what we are doing and goes out and does something else
>as a result -- we have completed our task as a group.

SS offers several useful things to us, but the modem/radio integration issue
can be solved in other ways (and has been for 56 kb with the DSY RF modem
and for 9600 with the Tekk data radio). The big things SS buys us over NB
techniques is greater resistance to multipath and a better way to share spectrum
with other users. Both are valuable traits, but touting SS as the answer to
modem/radio integration really misses the point.

The real task for 9600 baud is to communicate clearly to amateurs that Icom, Yaesu, and Kenwood are *lying to them* with their claims of "9600 baud ready", and that they need a *data* radio to operate data modes. If we can couple that with exploding the myth of dual use, we'll have solved this integration problem.

>of the same ..."

When you have read the other messages I posted in this thread, you know
that it is not my opinion that the availability of new technology will
automatically improve the packet network. There are financial and
cooperation problems that are more important than the technical problems.

However, technologies that are *not* available to amateurs can *not* be
used no matter how cooperating we are. So there is little point in bringing
them up.

(of course it would be nice if we had a network of 3 geo-stationary
satellites that we could use for a world-spanning packet radio network that
does not need to use Internet as a tunnel, or store-and-forward satellites
as forwarding mechanism. but we don't have it and we can't build it.
SS and advanced modems may be closer to reality, but still beyond reach)

>ever allow effective networks to be established and maintained.

7x24 (unattended) operation is not allowed under our license conditions.
you have to be near the transmitter when it is being operated.

of course, some people do it anyway, and it is hard to check so usually
one can get away with it. however, there still are many operators who
turnoff their station after use, if only to conserve energy and avoid
the noise of continuously running fans and disks.

when packet cannot operate in such an environment, it can never be successful
here. but of course it can, the essential parts of the network (nodes, BBSes)
operate under a special license and do store-and-forward operations for those
that are not QRV 7x24.
only this will make it hard to convince the average user to install
equipment that serves more than his own needs.

Hello, Folks:

I have been reading this thread with great interest in hopes of some valuable information being brought up, and there has indeed been some shared.

I have so far not posted on this topic prefering instead to read and learn.

As some of you may know, the HAmPS group is just starting to look into ideas for a very high speed packet network that would be particularly well suited to areas with lower population densities. I was hoping to see some ideas that would help in this thread.

I only have two comments to add at this time...

First, I hope that the trend of the past few days by a couple of posters does not continue and turn this thread into more of the same garbage that can be found in R.R.A.misc and policy. Please keep the mindless, uninformed drivel and the name calling to the appropriate areas.

Second, I wanted to thank those that have been posting their ideas and comments that are appropriate to this thread. They are proving to be valuable!

Take Care & 73

Well, I'd agree that they're at least as important as the technical
problems ... but the "technical problems" are perhaps more (bad)attitude
and (un)willingness to adopt new things than "availibility of better
technology ...

> However, technologies that are *not* available to amateurs can *not* be
> used no matter how cooperating we are. So there is little point in bringing
> them up.

I guess we differ in our definitions of "available" ... I tend to think of it
as "discovered, published, or otherwise known of ..." you seem to think
of it as "in the HRO/AES catalog" or "available as a kit" or something
to that effect ...

> (of course it would be nice if we had a network of 3 geo-stationary

They are NOT beyond reach ... please stop perpetuating this self-fulfilling,
stagnating myth ... you do more harm by propagating that myth and the
defeatist attitudes that go with it than you may realize ...

Again, there is no common sense reason to prohibit 7x24 operation of
a network ... have you even tried to mount a concerted effort to get more
reasonable rules??? (as a former client of my consulting practice used
to say "don't ask, don't get ...")

Jim, I can't help you with expanding the memory of the UTU, but if you are only using the keyboard to *send*, why are you using a TU at all? There are a number of programs available for the PC which will key the transmitter directly via a serial or parallel port pin, no TU required at all. And you can have a type ahead buffer as large as your PC's memory in that case.

Well, it's not exactly "more fun," it's the same amount of fun crammed
into a smaller period of time. I have it on good authority that, not
all that long ago, folks had a whole lot of fun on Land Line BBSs at a
speedy 300 baud. I've heard of even slower speeds, but those must
surely be in the realm of Urban Legends, right?

Well, you're having fun, and that's the whole point of ham radio.
Still, unless you're seamlessly interconnected to the "regular" RF
packet net, you probably aren't doing much for the health of the
national or world-wide "network."

<new technology won't solve the basic problem>

>Newer technology such as Spread Spectrum will change things a lot. One

Someday, MAYBE. So far, we don't even have a rules change allowing it. SS is so much Pie In The Sky for the foreseeable future. I'm skeptical that it'll ever be used in a WAN system anytime in the next ten years. By then, something newer and better may come along. By all means, continue to think and push for SS, but interim ideas are needed, particularly to address the basic "human" problems involved, which will not change no matter what sort of gee-whiz system you're using.

>> - Why do I not see the TAPR side of this controversy in *packet radio*
>> bulletins?
>
>Mostly because most of the "doers" at TAPR consider *packet radio*
>bulletins to be pretty much irrelevant. Great phrase swiped and

That's a very revealing comment, and seems blatantly elitist and condescending to me. If Packet Radio is irrelevant, what the hell do we need TAPR for, anyway? I thought the letters PR stood for *Packet Radio*, not Internet Service *PR*ovider.

>modified from a Star Trek movie: "Amateur Packet Radio Bulletin Board
>Systems? Oh... How quaint.")

That's just sad. It explains a lot, though.

>I'm replying to this thread on r.r.a.d.m.
>because it's not terribly painful to do so and my post addresses an
>audience that I consider relevant. I simply wouldn't bother on a PBBS.

If you or someone else had bothered to post some of this on packet, perhaps you'd have gotten your message out to those who are ON THE PACKET NETWORK. If TAPR doesn't really care any more about packet and wishes to kill it off, fine, but they really should change their name.

>If someone cares to port this message to a PBBS... fine with me, but
>it's probably too long for a PBBS message, I didn't put hard C/R's in

Oh, please. Any decent text editor will wrap your lines for you. That's no excuse for not posting.

>looks crappy on a Commodore 64. The last time I looked at a "BBS", I

Nor is that. I've got news for you, but not many hams use C-64s any more, believe it or not.

>was apalled that the user interface (and that's being charitable) hadn't
>changed in the 3 or so years since my previous look. There's only so
>many hours in the day.

BBS software needs updating, yes. But with the net dying and folks like TAPR banning one of the few active BBS authors, what did you expect?

>> - Is there any truth to the many accusations that TAPR is promoting
>> use of the Internet as a linking method, to the detriment of the
>> existing ham RF links?
>
>Not to the deliberate detriment of any other linking method- use

Deliberate or not (and your comments above make me wonder about that),
the net (heh) effect of promoting the Internet to bypass RF links IS
detrimental to development of a viable RF network.

>whatever works and makes sense for the particular application. If
>creating such a link "causes" problems with "existing ham RF links",
>that's "Evolution In Action". What TAPR has said (my intrepretation) is

Yep. We're evolving to the telephone, and Ham Radio is going the way
of the dodo bird. Our bands will soon follow.

>that it's OK to use non-Amateur linking- a mux port on a cross-country
>fiber, some unused time on a geostationary satellite, and yes, tunneling
>through the Internet to link Amateur Radio systems. Sometimes you can't
>(sometimes due to expense, lack of sites, lack of manpower, any NUMBER
>of reasons) can't use Amateur Radio exclusively. That's OK.

Yes, I believe it is, but with the attitude expressed above, TAPR
seems to think that the packet network is irrelevant. If that
attitude prevails, there'll soon be no radio net left to interact with
the LL nets.

>In my opinion, the Internet is a bigger draw than Amateur Radio. Most
>of the Amateur Radio "content" is boring... for sale or swap, medical

Boring is in the eye of the beer holder. The ratio of Signal to Noise
is far worse on the Internet than on packet radio. We just have
better control of topics here. Some cooperation, coordination, and
simple software additions would solve that problem on packet easily.

>problems, DX, contesting. The Internet by contrast is fascinating.

It's faster, different, and unregulated. It's no more or less
"fascinating" in and of itself. Set up the equivalent of an IRC net
on local packet nets, and you might draw a lot of interest. Most of
the tools are already there. Some folks are trying to drum up
interest by promoting HTML on packet. They're greeted with the same
old resistance by the Luddites, of course.

>INTERESTING to me, and what keeps me in Amateur Radio. Put another way,
>I'm more interested in doing networking by using Amateur Radio than
>doing "Amateur Radio Networking". As far as I can tell, my use of
>Amateur Radio is a legitimate one.

If it's within the rules, and you enjoy it, it's legitimate. Whether
or not it's conducive to the growth of ham radio is another subject.
I won't judge you on that.

>> - Why has Hank Oredson W0RLI been banned from TAPR discussion groups?

>privilege of using TAPR's mailing lists.

I've exchanged dozens of messages with Hank, and I've read hundreds of
his messages on packet. I've never found him anything but reasonable
and polite if approached in that manner. He has an annoying habit of
expressing his opinion without sugar coating, and he has a LOT of
opinions. I like that, myself. I think Hank has earned the right to
be heard, at least. Banning one of packet's innovators from a group
representing itself to be promoting *Packet Radio* is contemptible, in
MY opinion. But then, some people don't seem to care to be exposed to
opinions that don't support their own. (nothing personal implied
here.)

>Disclaimers:
>I'm chair of TAPR's Networking Special Interest Group (TAPR's NetSIG
>mailing list), and TAPR Secretary, and proud to be so.

>be able to have a truly effective network ...

You could not be much more off... come and look at the network in
western Europe, where most countries have these licensing conditions,
and compare it to the situation in the USA. We have dedicated nodes
with 23cm (and higher) interlinks and local access on separate frequencies
for each region, not a web of individual stations operating as digipeaters.

>Again, there is no common sense reason to prohibit 7x24 operation of
>a network ... have you even tried to mount a concerted effort to get more
>reasonable rules??? (as a former client of my consulting practice used
>to say "don't ask, don't get ...")

Our license is, less than the license in the USA, focussed on the
building of networks for emergency operation. It focusses on
experiments by individual amateurs. In our license conditions it says
that the license is to enable experiments with radio equipment, and
exchange of information about these experiments. One is required to be
near the transmitter while it is in operation, to supervise its
operation and to be able to switch it off when it causes interference.
Building a network is not the purpose of this license.

For unattended stations, special permits are available that allow
operation on specfied (coordinated) frequencies.

I think this is very reasonable.
In fact, the license conditions have been revised about half a year ago,
the above topic was discussed with the amateur radio societies. The
authorities had proposed to drop it because it could not easily be
enforced (as you probably know it is quite common for laws and rules to
be dropped because they are not enforcable, here in the Netherlands),
but it was decided to keep it as it was. Mostly because it enables a
better coordination of network nodes, repeaters, etc.

>dlpearce@eos.ncsu.edu

This looks like an interesting chip, David. It can provide the baseband and computer interface part of a complete SS transceiver. It DOES NOT comply with current amateur SS rules, unfortunately, though it could be used under the TAPR STA. That's because it doesn't support the currently permitted PN sequences. But the FCC is currently in the process of relaxing SS requirements, including allowing use of any PN sequence, so the chip may be usable under amateur rules soon. Under that proposal, however, you need to implement automatic power control. Fortunately, this chip offers RSSI, so that could be implemented externally.

The one thing missing is price. If the price is low enough, this chip may become very popular with SS enthusiasts.

From: iwntzit@aol.com
Message-ID: <19970601063401.CAA18378@ladder02.news.aol.com>
Source record: 29709

Well I must not be a good programmer, already have a soundcard so why not try and find the software that can recieve RTTY/CW?I too am looking for the same thing. So if anyone knows anything please let me know and everyone else and I would not mind a bit of detail of how to work the program.I would greatly appreciate an email back, and thanks in advance.

>reading the chip specs correctly?

It is a bit of a pain, but it really is a good idea. Automatic power control
enforces a rule that amateurs have largely ignored in the past, IE the
requirement to use minimum power necessary for a communication.
It will greatly enhance spectral reuse, and it will make SS a better sharing
neighbor to other users of the amateur spectrum.

This requirement *should* be imposed on the commercial SS systems too,
but the trend there seems to be one of allowing greater and greater ERP
with little concern for spectral reuse or mutual interference. Perhaps a
good amateur example will ultimately be carried over to the commercial
world in this case.

Amateurs already have an example of automatic power control. That's
Clover II. It makes use of APC to maintain a specified link quality. The
amount of power really needed to maintain a high quality link is often
rather astonishingly low.

APC requires a protocol between the receiving station and the sending
station where the receiving station reports Eb/No to the sender and the
sender adjusts power to maintain a predetermined value, in this case
limited to 23 db in the proposed FCC rules. That's a good quality link.

This protocol probably can't be built into the chipset and needs to be
implemented at a higher level, probably at the layer 2 protocol level.
It's likely that power control will be applied to the PA in the form of an
ALC voltage, so the chipset really isn't involved. (It could be done at
the chipset level too if the PA is linear.)

Note that SS is not TDMA like packet, so there is no need to worry
about hidden terminal problems or dynamically changing APC on a
station to station basis every frame. SS works effectively like an
exclusive channel virtual circuit between pairs of stations. That's
the same way Clover II works. We almost certainly won't want to
use AX25 at layer 2 for SS. Since we have this opportunity to design
a new layer 2 protocol anyway, we might as well include APC.

Note that the proposed rules don't require APC if we limit ourselves to 1 watt or less. Since most of the commercial SS equipment we might want to use is also limited to 1 watt, this really doesn't present a burden to us as far as adapting commercial SS systems to amateur use. Only if we want to use higher power (we're allowed up to 100 watts) would we need to implement APC.

How did you get from "packet radio bulletins to be pretty much irrelevant"
to "packet radio is irrelevant?"

Those are two completely different sentences by the way. Is English your
second language?

Why don't we end the argument now. It was boring a week ago. Suffice
to say, that there are people in existence that actually use a BBS, but it
is not mainstream. It hasn't been mainstream since CP/M.

Steve

The license referred to above is NON-exclusive ... I can license to
others as I see fit ... including the rice-box folks, but I don't see them
as being interested in anything different or "NIH" ... their customers,
today's hams, don't demand anything new or different from them ...
in fact, for the most part, they shun it because they don't understand
it and consequently fear it .... sad ...

> I expect its completely software anyway and would work with any
> dsp powerful enough to run it.

It can be implemented in a mix of hardware and software, or in a
purely software form (preferred) using IF undersampling techniques
or "digital downconverters" ...

Careful here, you don't want to get accused of being a "witch" ... the
general population might decide to burn you at the stake of something
if you keep talking like that <grin> ...

> So with this design, it is relatively easy to upgade the system via
> software, so if you figure out a way to prevent problems possibly caused

> by multipath, you just load it in later.

This is accurate ... my techniqe could be implemented as a piece of
DSP code that gets downloaded into one of these new-type radios where
everything is digitized at an early stage and channel selection, mod/demod,
and other functions that hams are used to having done in purely analog
circuitry are done in a DSP ...

> for each region, not a web of individual stations operating as digipeaters.

Below you state (for the first time I've seen in this thread) that unattended
operation IS permitted with special permits ... I would not presume to differ
with the architecture you suggest with dedicated nodes rather than "a web
of individual staions operating as digipeaters" ... the digipeater is an
abortion.

However, I still would maintain that you're loosing a lot of effectiveness and
ability by not permitting user stations to be on-line on the network 24x7 ...
this drives you to the (IMHO) rather ugly paradigm of the BBS (no offense,
Hank, but I prefer other mail delivery mechanisms) and limits the user and
the system in other ways as well ...
>
> >Again, there is no common sense reason to prohibit 7x24 operation of

> >to say "don't ask, don't get ...")
>
> Our license is, less than the license in the USA, focussed on the
> building of networks for emergency operation.

The networks don't have to be primarily intended for emergency operation ...
I'm just asserting that 24x7 networks are just capable of prividing more
usable services on a real-time basis ...

> It focusses on
> experiments by individual amateurs. In our license conditions it says

> that the license is to enable experiments with radio equipment, and
> exchange of information about these experiments.

I could get behind a US rules change to make that perfectly clear ...
Part 97.1 essentially says that now, but in a left-handed sort of way that
opens the door for distortional arguments by a lot of gamers and appliance
operators who insist that their activities are the primary raison d'etre for
amateur radio ...

> One is required to be
> near the transmitter while it is in operation, to supervise its
> operation and to be able to switch it off when it causes interference.

This seems to automatically presume that it *will* cause interference
which seems like a rather pessimistic outloook ...

> Building a network is not the purpose of this license.

Building a network would provide just the sort of testbed that you
need for experimentation with all sorts of things ...

> For unattended stations, special permits are available that allow
> operation on specfied (coordinated) frequencies.
>
> I think this is very reasonable.

I find it unnecessarily resstrictive, but where you live is your country and
you're free to have whatever rules you wish ...

> In fact, the license conditions have been revised about half a year ago,
> the above topic was discussed with the amateur radio societies. The
> authorities had proposed to drop it because it could not easily be
> enforced (as you probably know it is quite common for laws and rules to
> be dropped because they are not enforcable, here in the Netherlands),
> but it was decided to keep it as it was. Mostly because it enables a
> better coordination of network nodes, repeaters, etc.

I can see a certain amount of practical value in this final aspect ... rather
than having to deal with "rebels" and lids who insist on doing disruptive
things at the peer-peer or association-individual level you have delegated
that function to the government ... if they bother to enforce it, it may have
merit ... if they are like the FCC and have abdicated any semblance of
enforcement responsibility, then it puts you in a worst position than having
to try to do the job yourself ...

Hi there!

My SWL pages are updated. Come and have a look at:
- decoding software
- build your own T2FD receiver antenna
- links to broadcasting stations and fellow pages
- control software for the NRD535
- frequency databases for automatic tuning *with that software)

And also download the lite version of this fabulous multimode data program that works with a simple hamcomm modem, It's called RadioRaft!!

Cya around!

Kees

>that are not QRV 7x24.

Yeah, that's the problem. You're limited to the old paradigm of BBSs and store
and forward nodes. You can't make use of effective LAN topologies and distributed
computing resources. Your users might as well be using teletypes.

>only this will make it hard to convince the average user to install
>equipment that serves more than his own needs.

True. That sort of limited paradigm does make it hard to get users to
put up resources for the LAN to access. In a real modern network
environment, every machine can contribute in a near seamless manner
to the operation of the whole. This allows the user to draw cooperatively
on the resources of other users with applications. You can't do that with
the paradigm you're stuck operating under.

BINGO!

That's the problem. Those talking about the "packet network" are mostly
stuck in a timewarp talking about the BBS paradigm serving a user community
who might as well be using teletypes. That's not where networking has evolved
since the days of the mainframe. Today, a network must support distributed
cooperative applications. Every station needs to be both a supplier and
consumer in the network. If my application needs a bit of extra data storage
and another user has idle storage, it is available seamlessly on the network.
Conversely, if his application needs more CPU cycles, and my machine has
idle CPU cycles, it supplies them to his application seamlessly over the network.
That's the kind of packet network we are working toward, not some clunkly
dinosaur emulation of a mainframe and with teletype logged in users paradigm.

I think what we are seeing is the death of the amateur packet *WAN*.
We don't have the resources to compete with the commercial networks
in this area. But we do have the resources to put up very useful and
interesting LAN and MAN systems. TAPR has said that we need to
focus our attention in this area where we can be productive and competitive.
I think that is exactly right for this time.

There may come a day when we'll be able to do useful WAN architectures
again. But for now at least, we don't have the regulatory relief or the manpower
or funding to do so in anything but a toy fashion. And the internet makes such
toy systems irrelevant and uninteresting to most people.

QST did exactly that a year or so ago. They continue to include BER
stats in reviews. Unfortunately, they don't include a baseline or any
other helpful information in the reviews, so the unsuspecting buyer
doesn't have much to go on. I suspect they do this as much out of
fear of antagonizing the advertisers as from their typical
incompetence at putting things in clear, understandable form.

Of course, when all hams are required to have Coffman's expertise in
such things, that'll no longer be a problem, will it? Plus, QST and,
probably, Ken-Su-Com, Inc. won't be around then, either.

>Oh well... can't please everyone.

It's TRVTH.

> popular with SS enthusiasts.

Latest issue of one of the trade mags that I get (Communications Products) says

$23.05 for the SX047 at the 10k quantity level ... this is VERY pricey for the
functionality
provided and considering everything else that needs to be added to make a
complete
system, would probably result in a BOM cost/selling price that most cheapskate
hams
would balk at ...

Note, I'm not saying it's a bad device or that it couldn't be used when the
Part 97 SS
rules are modernized ... just that it's a bit pricey for what it does ...

2921. General NetworkIdeas

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-02 00:00:00 UTC
From: marty@trucom.com
Message-ID: <33923b70.7692212@news.trucom.com>
Source record: 29732

Let me bounce a few general concepts off of the readers here and see what sort of comments and/or suggestions that you may have...

First, the basic geography of the area is such that there is an area about 125 miles by 150 miles with a distance of about 35 miles between population centers. The terrain is low, rolling hills with the occasional "big hill". (I won't call them mountains!)

My initial impression is that what is needed to provide good packet coverage for the area would be for LAN/MAN structures in the population centers and having those tied together with a WAN structure. The question comes in as to how fast the two structures need to be in relation to each other.

I would envision various services, such as a BBS and, perhaps, a DX Cluster and Convers server, in each LAN so that users would not need to use the WAN to get to these services. The WAN would mostly serve to pass information between the LANs.

Obviously, the LAN would need to be as fast as possible (ideally) but most of the users would still be at 1200 bps for at least the near future. With work being done with SS and other systems, perhaps the users will be accessing at Mbps speeds in the not too distant future. Ideally, the WAN would be able to be designed and constructed to be able to deal with this in the future.

So, if we assume that most users will be using 1200 bps now, perhaps moving up to 9600 bps fairly soon, maybe even 56K not too far off, and Mbps speeds within a couple of years, how fast does the WAN need to be?

My gut feeling is that a 56K WAN would do the trick IF users were to stay in their LAN for BBS and other services.

Any comments?

Take Care & 73

>wishes to kill it off, fine, but they really should change their name.

Actually, it seems that most of the "doers" involved in what you consider to be
"the packet network" make considerable use of the Internet. Could be a message
in there somewhere. :-) So, I expect that comments posted here or on some of
the more popular mailing lists find their way to most of the movers and
shakers. At the risk of repeating myself: TAPR is not out to kill anything,
it's simply putting effort into new directions which we feel will ultimately
benefit the hobby.

>> - Is there any truth to the many accusations that TAPR is promoting
>>> use of the Internet as a linking method, to the detriment of the
>>> existing ham RF links?
>>
>>Not to the deliberate detriment of any other linking method- use
>
>Deliberate or not (and your comments above make me wonder about that),
>the net (heh) effect of promoting the Internet to bypass RF links IS
>detrimental to development of a viable RF network.

I disagree. In my view, an all-RF WAN can never be viable. What we need
is a viable network which incorporates RF. An effective network is a useful
adjunct to many facets of ham radio. It is no less so simply because it
includes some non-RF links - on the contrary, such links allow us to
concentrate on the areas where RF can really shine, in supporting high-speed
applications and mobility.

>>whatever works and makes sense for the particular application. If
>>creating such a link "causes" problems with "existing ham RF links",
>>that's "Evolution In Action". What TAPR has said (my intrepretation) is
>

>Yep. We're evolving to the telephone, and Ham Radio is going the way
>of the dodo bird. Our bands will soon follow.

That could very well be, but you're blaming the wrong people. TAPR is promoting high-speed RF LANs and MANs. Its efforts to support high-speed RF R&D, and to get the rules relaxed so as to encourage more experimentation, are one of the most visible indications to the spectrum regulators that there is still some life in ham radio. This is far more influential in convincing the powers-that-be that we should retain some spectrum for the service than the outdated notion of building low-speed WANs for PBBS forwarding.

>Yes, I believe it is, but with the attitude expressed above, TAPR
>seems to think that the packet network is irrelevant. If that
>attitude prevails, there'll soon be no radio net left to interact with
>the LL nets.

Nonsense. The term "packet network" encompasses many different possibilities other than PBBS forwarding networks. TAPR's vision of what the network should evolve into may differ from yours, but it still involves radio. If the vision comes to pass, it will result in a far useful "packet network" than the one you're talking about. It will actually attract newcomers to the hobby, and encourage the development of networking and wireless skills which are relevant to what's going on outside the hobby. The establishment of amateur packet radio as a fertile training ground for wireless networking is probably the best hope we have of holding on to our bands, not to mention the fact that high-speed networks are needed to support the kind of interactive applications that many of us want to use these days. Interactivity is what ham radio is supposed to be about, no?

>Boring is in the eye of the beer holder. The ratio of Signal to Noise
>is far worse on the Internet than on packet radio. We just have
>better control of topics here. Some cooperation, coordination, and
>simple software additions would solve that problem on packet easily.

Sweeping generalization alert! You speak of the Internet as if it is a single network, or network application. There are thousands of newsgroups, mailing lists and chat systems on the Internet. The SNR similarly runs the gamut from abysmally low to extremely high (this newsgroup, unfortunately, is not always a good example of the latter :-). With a little selectivity and the many software tools available, you can access more high-SNR material than you could ever hope to keep up with. In my experience (which is substantial in both cases - I've run a PBBS for more than 10 years, and I've had Internet access for about 10 years), there is just no comparison - the Internet apps leave the PBBS network in the dust.

>>problems, DX, contesting. The Internet by contrast is fascinating.
>
>It's faster, different, and unregulated. It's no more or less
>"fascinating" in and of itself. Set up the equivalent of an IRC net

>the tools are already there. Some folks are trying to drum up
>interest by promoting HTML on packet. They're greeted with the same

>old resistance by the Luddites, of course.

Where've you been? The IRC-like global ham radio "convers" network has been operating for years. For some packet users, it's their favorite packet radio application - it's not unusual to see 100+ users in 15-20 different countries online. The Internet gateways are instrumental in providing the connectivity for this network, but most of the users access it by radio. Similarly, HTML (and even digital audio and video) is very common on packet in areas where higher-speed MANs have been implemented.

>>INTERESTING to me, and what keeps me in Amateur Radio. Put another way,
>>I'm more interested in doing networking by using Amateur Radio than

>>Amateur Radio is a legitimate one.
>
>If it's within the rules, and you enjoy it, it's legitimate. Whether
>or not it's conducive to the growth of ham radio is another subject.
>I won't judge you on that.

I think the re-focusing of our efforts into higher-speed LANs and WANs is not only conducive to the growth of ham radio, it may be vital to its survival.

>>you have to be near the transmitter when it is being operated.

>Pity, sounds like you need to lobby for better rules.

As I explained before, I don't think this rule is so bad.
It nicely serves to regulate the number of BBS and DXCLUSTER systems
in a certain area.

>>when packet cannot operate in such an environment, it can never be successful
>>here. but of course it can, the essential parts of the network (nodes, BBSes)
>>operate under a special license and do store-and-forward operations for those
>>that are not QRV 7x24.

>Yeah, that's the problem. You're limited to the old paradigm of BBSs and store
>and forward nodes. You can't make use of effective LAN topologies and distributed
>computing resources. Your users might as well be using teletypes.

Apparently you see a cloud of user stations operating as digipeaters
as an effective LAN topology. Over here, we use established user-access
points to the network, to which all the users in a small area directly
connect. So, it is no problem when not all users are QRV all the time.
Of course, the node operates under a special license for unattended 7x24
operation.

>>only this will make it hard to convince the average user to install
>>equipment that serves more than his own needs.

>True. That sort of limited paradigm does make it hard to get users to
>put up resources for the LAN to access. In a real modern network
>environment, every machine can contribute in a near seamless manner
>to the operation of the whole. This allows the user to draw cooperatively
>on the resources of other users with applications. You can't do that with

>the paradigm you're stuck operating under.

I don't believe that this is our problem. Any user can buy all the
computing power he will ever need for his own applications for a small
amount of money at the local computer store, these days. We don't need
to borrow eachothers CPU cycles.
The wellknown applications such as BBS systems, DX clusters, WWW servers etc
can operate under a special license.

A working network is not going to pop up out of a cloud of users permitted
to run 7x24 systems. A clutter of BBSes is, however, very likely to result
out of it.

>this drives you to the (IMHO) rather ugly paradigm of the BBS (no offense,
>Hank, but I prefer other mail delivery mechanisms) and limits the user and
>the system in other ways as well ...

What is it that the user and the system have to offer to the world while
no person is nearby? And that could not be provided by a BBS, of course.

>> It focusses on
>> experiments by individual amateurs. In our license conditions it says
>> that the license is to enable experiments with radio equipment, and
>> exchange of information about these experiments.

>I could get behind a US rules change to make that perfectly clear ...
>Part 97.1 essentially says that now, but in a left-handed sort of way that
>opens the door for distortional arguments by a lot of gamers and appliance
>operators who insist that their activities are the primary raison d'etre for
>amateur radio ...

There also is a paragraph that says that importance of the traffic must
not warrant the use of the public telephone system. Maybe that is similar
to what you have? It seems to be there mostly to avoid the use of amateur
radio as a replacement for (mobile) telephony.

>> One is required to be
>> near the transmitter while it is in operation, to supervise its
>> operation and to be able to switch it off when it causes interference.

>This seems to automatically presume that it *will* cause interference
>which seems like a rather pessimistic outloook ...

This may be true in the current amateur radio, where everyone operates
commercial transceivers which seem to be reasonably reliable.
(although commercial transceivers exist that send spurious transmissions each
time they are keyed, and the fact that nobody complains is probably caused
by the fact that it is difficult to recognize it as interference)

When the radio amateurs would really be doing what the license presumes
them to do, there would probably be more interference as well.

>> Building a network is not the purpose of this license.

>Building a network would provide just the sort of testbed that you
>need for experimentation with all sorts of things ...

That is why it is allowed, and why we are doing it.
(although there are still far too many users who like to see the network
as a mechanism for transport of their data, it really is just a big social
experiment with some room for technical experiments as well)

>> For unattended stations, special permits are available that allow
>> operation on specfied (coordinated) frequencies.
>>
>> I think this is very reasonable.

>I find it unnecessarily resstrictive, but where you live is your country and
>you're free to have whatever rules you wish ...

In practice, some coordination and regulation is necessary to protect
the freedom of everyone. Allocation of frequencies to areas and services
seems to be one such thing. In the early days we just had a couple of
"packet radio frequencies" and everyone just used one, but that did not
work well.

>> In fact, the license conditions have been revised about half a year ago,
>> the above topic was discussed with the amateur radio societies. The
>> authorities had proposed to drop it because it could not easily be
>> enforced (as you probably know it is quite common for laws and rules to
>> be dropped because they are not enforcable, here in the Netherlands),
>> but it was decided to keep it as it was. Mostly because it enables a
>> better coordination of network nodes, repeaters, etc.

>I can see a certain amount of practical value in this final aspect ... rather
>than having to deal with "rebels" and lids who insist on doing disruptive
>things at the peer-peer or association-individual level you have delegated
>that function to the government ... if they bother to enforce it, it may have
>merit ... if they are like the FCC and have abdicated any semblance of
>enforcement responsibility, then it puts you in a worst position than having
>to try to do the job yourself ...

That is not completely the way it works...
The part played by the government is only the imposing of the rule that one
is not allowed to operate 7x24 without a special license, and sometimes
applying sanctions when someone still does. Indeed, they are difficult to
get moving when a problem exists. They seem to monitor randomly, and don't
have the expertise to recognize the real problems quickly. Bad mistakes
have been made in the past, and since then they are reluctant to identify
people or systems using the data they monitor.
(now they basically act only upon RF being monitored at a transmitter site)

The frequency/area/service coordination is not done by this government body,
however. A special committee was formed, with members from the amateur
radio societies, which advises the government body when someone applies
for a 7x24 unattended operation license. A frequency is also advised by
this committee. The government body always follows this advise.

Of course it has advantages and disadvantages. The clear advantage is that
the node network and BBS system is relatively stable and well-distributed.
Newcomers wanting to start a new system are forced to take some formal steps

and thus are more likely to think about what they want, how it could
supplement what is already there, etc.
The disadvantage is that things sometimes move slowly. Very slowly.
Next month a new frequency plan for the 70cm local access frequencies
will be introduced. It became necessary when the increasing traffic
and the increasing number of systems required a larger segment of the
band to be allocated to packet radio, and we had painted ourselves in the
corner by haphazardly allocating frequencies in the past.
However, because of all this committee stuff, and because of all the
coordination with neighbor countries (where similar mechanisms are used),
it took several years to finally come up with an acceptable plan.
In the meantime, the situation has been unbearable in several areas...

As a firm believer that everything the Computing Science Research Center (http://cm.bell-labs.com/cm/cs/) does, is valuable and revolutionary. I think everyone should get on board the Inferno(TM) and Plan9 wagons. Both are Distributed Computing Environment at its best.

Inferno is what Java claimed to aspire to. I think inferno will revolutionize the way everything is done. While Java is a programming language on top of a virtual machine, Inferno (that Italian boy Dante) is a complete network node. Java would be a good candidate language, but of course the lab designed their own called Limbo. What's really nice, is Inferno assumes a 32 bit integer. So take those Z-80's and dump them wholesale :-)

See:

http://inferno.bell-labs.com/inferno/infernosum.html

One of the arguments for RF WAN is that it will operate when the wireline Internet collapses (say in an emergency). Theoretically this can be true, however in actuality it is merely a wishful thought.

So by stating that we need RF WAN because of it's greater capability in a disaster, and shun wireline as being too fragile, mostly these gomers saying that are sure to be high on opium. The X generation has winners and losers like every other generation, but in this case the X are circled around the BBS bonfire.

How in the hell is your RF WAN going to operate in a disaster? Does it have Solar panels? Wind generators? Honda generators? The Survey Says! NO. Most WAN nodes are like the LAN hams shack. Void of any emergency power.

Magazine articles on emergency power have been .0001 percent. The ARRL doesn't have any real thoughts on the matter either (judging from their annual book).

Steve

Considering the technical skills of a large segment of the amateur community,
that *is* what is meant by available. That's reality, and it isn't going to change
much in the near future. Maybe it can change in a decade or two with some
reforms, but not in time to address today's networking needs on a very large
scale.

Please explain to AMSAT how to *fund* such a system. It was one of the
planning options as a follow-on to Phase III, but it became very clear that
there was no way to raise sufficient funds in the amateur community to
pay the launch costs of such a constellation.

Nope. I've been there, done that, used a Radio Shack accoustic coupled modem on a printing terminal at work with dial up BBS'. Had a lot of fun, learned a lot, and moved on.

> Still, unless you're seamlessly interconnected to the "regular" RF
> packet net, you probably aren't doing much for the health of the
> national or world-wide "network."

The Puget Sound Amateur Radio TCP/IP Network transports any IP packets that it can figure out how to route. If users wish to interconnect with Net/ROM'ish nodes, DX PacketClusters, APRS digipeaters, cool. The wide area and local bit regen repeaters regenerate any properly constructed ax.25 packets heard on the input. We have a router connected to the Internet for wide area transport. It's my hope, currently not very realized, is to connect via the Internet with other areas of the US and worldwide that have substantial local Amateur Radio TCP/IP operations.

What we (those of us that built and maintain the P.S.A.R. TCP/IP Network) chose very deliberately NOT to do was to do anything with Net/ROM'ish networking, digipeating, Packet Radio Bulletin Board Systems. We chose to use TCP/IP, a very robust networking and message transport protocol that has a future and is interoperable with the Internet.

> If Packet Radio is irrelevant, what the hell do
> we need TAPR for, anyway? I thought the letters PR stood for *Packet
> Radio*, not Internet Service *PR*ovider.

My original comment said that Packet Radio Bulletin Board systems were considered irrelevant by most of the "doers" at TAPR- that's why you seldom see a TAPR viewpoint posted on Packet Radio Bulletin Boards.

"Packet" Radio is an incredibly inclusive term- it would apply equally well to a system whose throughput is T1 (1.544 Mbps) and whose frames are identical to Ethernet frames. Packet Radio is just that- the transfer of PACKETS over RADIO. You seem to think that any networking that doesn't involve AX.25, Net/ROM'ish networking, and PBBS message forwarding ISN'T

"Packet Radio". That's simply not the case!

The name Tucson Amateur Packet Radio has evolved since its founding. The organization is no longer located in, or specific to Tucson (although it maintains a business presence there). It has evolved to a National, and International resource on Digital RF Communications with a specific focus on Amateur Radio. Note that the name does not refer to AX.25, Net/ROM'ish networking (or Texnet, or ROSE, or FlexNet, or TCP/IP, or PBBS Message forwarding). TAPR created the first and second generations of TNC's. It's evolved from those founding products, just as it's moved on from its original location in Tucson. Since TAPR doesn't have paid staff, TAPR relies on volunteers to accomplish its mission. Volunteers contribute where they feel their efforts make a difference.

The TAPR name is well known nationally and internationally. It works. We like it. We'll keep it.

> If you or someone else had bothered to post some of this on packet,
> perhaps you'd have gotten your message out to those who are ON THE
> PACKET NETWORK. If TAPR doesn't really care any more about packet and
> wishes to kill it off, fine, but they really should change their name.

<sigh...> If you can point me to a newsgroup or Internet-compatible e-mail address to do so, I will consider doing so.

> Yep. We're evolving to the telephone, and Ham Radio is going the way
> of the dodo bird. Our bands will soon follow.

Use of the Internet does not equate to using the telephone. In the case of the Puget Sound Amateur Radio TCP/IP Network, bring we bring TCP/IP on RF right to the Ethernet of a Seattle-area Internet Service Provider. No telephone lines involved. The ISP uses multiple Intenet backbones, with redundant connections. Their data center is fully earthquake hardened and capable of running for days on generator power. Again... no telephone lines involved.

On the contrary to your gloom statement above- I think it says a lot to the relevant authorities that hams are able to demonstrate the use of a robust, Internet-interoperable networking protocol on 1200 baud and 9600 baud RF links.

> Thanks for your thoughtful post. It's been enlightening. Perhaps
> others will add similarly thoughtful comments. I still don't think I
> have the whole picture here, but it's starting to take shape out of
> the mists, at least.

You're welcome. We've educated you, maybe, on the relevant issues, and maybe a few lurkers. Then in a year or so someone else will come along and state the same things and then we'll start over. Eventually folks with valuable info just wear out and stop posting, and I don't blame them.

No, I'm not talking about a cloud of users acting as digipeaters (how quaint).
I'm talking about a network of stations running cooperative applications. These
distributed applications are the future of network operation. Or at least they
could be if we could get users to stay put in the network and participate.

>>>only this will make it hard to convince the average user to install

>to borrow eachothers CPU cycles.

Of course we do. That can allow us to be much more productive without consuming all of our limited network bandwidth. Agents, applets, crawlers, and other sorts of distributed computing applications depend on access to CPU cycles on *many* computers to effectively provide their services.

We've got to stop thinking in terms of central resources accessed by dumb teletype emulating users. That effectively limits our computing power to a fraction of one central PC. We've got to start thinking in terms of cooperative distributed computing. That's the way to really tap the power of networking to our benefit. Think of a modern network as a huge loosely coupled multiprocessor system with capabilities greater than any single supercomputer. That's what we *could* have if we weren't stuck in a BBS and teletype emulating gadfly user paradigm.

Preach it brother. :-)

Inferno is definitely hot. Put it on your Linux box *now* in hosted mode, don't wait
for the movie (kernel code). It's here, it works, and it can revolutionize our network
paradigm. There's even a hosted version that'll run on the Microsoft virus for those
poor souls who haven't yet made the switch to a real operating system.

Now *that's* a very revealing comment. You appear to be saying that
packet radio is just a bunch of bulletins exchanged by some toy BBSs
over radio. That may be the only packet *application* you recognize, but
it isn't packet radio. Packet radio is a method of exchanging digital
information, *any sort of digital information* among a cooperating group
of stations. The BBS paradigm was one early application of packet radio,
but it is no longer a very useful or interesting application of packet radio.

>Did I make a bad purchase? (I paid $150)

You stole it. Timewave took over AEA's digital line, including the DSP232. They are currently in the process of totally revamping the firmware for that box to make it really do what it was supposed to do (but didn't) when AEA released it.

>I also have my original AEA232. Should I keep this or sell it due to the
>fact me DSP model can do what it does and more?

Hang onto it for a while until Timewave releases the new firmware for the DSP232. They have committed to supporting those who own the old PK232 (repairs, parts, etc), but they aren't going to build any more or do any more upgrades to it. It is a mature product, however, and will remain useful for a while yet. The DSP232 isn't yet mature, but when Timewave delivers on the new firmware it will be a powerful replacement for the PK232.

>Any comments?

Your analysis appears sound. The greatest need for speed is at the LAN
level. The WAN speed is not as critical since it doesn't have to support
as much realtime interactivity. A 56 kb backbone WAN should be sufficient
for quite some time. You want to move your LAN speed up as rapidly as
possible. Try to jump your users up to at least a 56 kb duplex system
now (like those in Ottawa and Atlanta), and move them to 256 kb or 1.2 Mb
as soon as possible. IMHO 9600 baud is a dead end. I'd discourage you
from even considering that option.

56 kb is now an off the shelf option for users, and the Slovenian systems
offer the faster speeds for the more adventurous. When and if SS systems
become widely available, they'll need a different topology, IE instead of the
traditional contending hub and spoke we've come to use for TDMA, we'll
want a more mesh-like network of point to point virtual connections with SS
(hub and spoke is very inefficient for SS, and contention has a very different

meaning for SS). I wouldn't base any near term networking plans on SS just yet. Let those who are interested experiment with it and work out the best methods to network it first. That'll almost certainly require a level 2 protocol different from AX25. (You can participate in that, but do it as a separate activity from your utilitarian networking for now.)

Your biggest problem is dealing with legacy 1200 baud users. If you can't gateway them into your new network, they'll build a parallel 1200 baud network and sap resources from your effort in the process. You need to establish gateways in each LAN area for the 1200 baud users. Obviously, this has to be on a different frequency from your normal network user frequencies. We use JNOS based switches to do this. Since our ordinary network switch is also based on a JNOS box, it can do double duty as a gateway device for the 1200 baud user simply by attaching another port. (Note a Linux based switch would be preferred, but the JNOS boxes are legacy items here and still serve adequately.)

The point that Gary seems to be trying to make appears to be the
same one I was trying to make ... that the paradigm of the whole
store & forward BBS thing is badly outdated an limited ... it's a shame
that your regulatory scheme limits you to that paradigm ... it's also
IMHO (with no intent to insult) sad that you seem happy with such a
limitations on what's possible ... we're at the point in the history of ham
radio where we need to be stretching our horizions, not sitting back,
content with what we have ... that sort of complacence will result in
our demise before we get too far into the next century ...

> Apparently you see a cloud of user stations operating as digipeaters

That's not what either Gary or I are talking about (which is not to say that
our respective visions are necessarily identical) ... I thiink we're both
talking
about the goal of a *true* network, not some kludge that only marginally
resembles a poor attempt at a network ... which is the "digipeater" paradigm,
which is worse, but only slightly than the BBS paradigm ...

> One of the arguments for RF WAN is that it will operate when the wireline
> Internet collapses (say in an emergency). Theoretically this can be true,
> however in actuality it is merely a wishful thought.

There is no valid reason for this to be the case ... theory and practice
need not differ ... all that's required are *competent* hams ...

> How in the hell is your RF WAN going to operate in a disaster? Does it have
> Solar panels? Wind generators? Honda generators? The Survey Says! NO.
> Most WAN nodes are like the LAN hams shack. Void of any emergency power.

That this may *be* the case does not justify a condemnation of the validity
of the "RF MANs/WANs are survivable for disaster communications"
hypothesis, but rather a damning condemnation of the average ham's
preparedness, understanding of what's needed for disaster communications,
and lack of technical ability to design and field a reliable system ...

Fix the problem by forcing the average ham to become competent to
operate or lose priveleges ... those that are "real hams" will rise to the
occasion ... those who are CBers with an attitude will go back to where
they came from and find competitive games to play that don't require RF.

Well, say that I want to send you an e-mail message and I want to
attach a 500k binary file (a .ZIP of my latest hacks to the source of
a program that we've been collaborating on, plus docs, etc.)

If I have to connect to some BBS, rather than sending it directly to your
machine, then it has to be stored at the BBS (as do all other traffic) and
it has to be transmitted again at a later time for you to download it ... it
would be more efficient to simply place the file on your machine, leaving
the BBS out of the picture ...

Many other applications come to mind, but it sounds sort of like you
have the view that a BBS is the answer to everything ... I don't share
that view and I hope you don't really either ...

> There also is a paragraph that says that importance of the traffic must
> not warrant the use of the public telephone system. Maybe that is similar
> to what you have? It seems to be there mostly to avoid the use of amateur
> radio as a replacement for (mobile) telephony.

I personally feel that content restrictions simply impede amateur
packet radio from becoming truly integrated with the larger world
of the internet ... this artificially limits what we can do and also
limits our ability to provide a useful service in times of disaster by
bridging outages in other networks in a seamless, transparent
manner for EMS agencies and other disaster relief efforts ...
(of course, we would have to have the network capacity to be able
to provide a meaningfully useful grade of service, but if we had the
ability to do, say 56kb and more, that would be a good start)

> >> One is required to be

> commercial transceivers which seem to be reasonably reliable.
> (although commercial transceivers exist that send spurious transmissions each
> time they are keyed, and the fact that nobody complains is probably caused
> by the fact that it is difficult to recognize it as interference)

In a more ideal world, hams would more universally be competent enough
that even homebrew gear would be reliable enough to "trust" it in unattended
operation ... if gear is not that reliable, it's likely to cause interference
even
with the operator in attendance ... if the op can't build it to work reliably,
he's probably not competent to recognize abnormal behavior, short of smoke,
fire, or complaints ...

> (although there are still far too many users who like to see the network
> as a mechanism for transport of their data, it really is just a big social
> experiment with some room for technical experiments as well)

I would find it absurd to expect that the builders of a network would
not expect that the primary perception of it's raison d'etre for most
users would be "to transport data" (hopefully in a timely and reliable
manner)

[snipped description of govt. vs. freq. coordinator functions]
> Of course it has advantages and disadvantages. The clear advantage is that

> Newcomers wanting to start a new system are forced to take some formal steps
> and thus are more likely to think about what they want, how it could
> supplement what is already there, etc.
> The disadvantage is that things sometimes move slowly. Very slowly.

Another disadvantage will likely be what we experience here ... the
"frequency coordinating body" becomes a "good old boy club" consisting
of and dominated by the current system operators ... who use the body
to establish their dominion over the bands, the users, and perpetuate the
status quo at the expense of progress that they have become too lazy or
backward to see as benificial ...

Hey I think we should start using packet on HF. Like RTTY, CW, and SSTV. Yes packet maybe slow. But using a telephone is a whole lot easier to use than SSB. Yet we still like to get on HF with SSB and talk to each other. So why not have the same attitude with packet radio on HF.

Unless all of us ham's are just too narrow minded to have fun with a new toy.

Jerry I thought CW was slow and tedious,waiting for something to happen
with an hf packet link has got to be the slowest means of getting any
message through.It wouldn't be a bad idea for it to just die it's
S L O W death as CW testing will.

Well, like it or not, that's where the action is for most of the
country. If you're trying to kill off the "NetRom" and BBS systems,
this seems like a good way to go about it. The fact that most of TAPR
finds them irrelevant is very revealing.

>"Packet" Radio is an incredibly inclusive term- it would apply equally

I have nothing against advancement. I object to the abandonment of
the old, functioning net (and what appears to be a concerted effort to
kill it off) before a viable alternative is in place.

Huh? Why would you need an e-mail address to post bulletins on the existing packet network? Are you that far out of touch with reality?

>> Yep. We're evolving to the telephone, and Ham Radio is going the way
>> of the dodo bird. Our bands will soon follow.
>
>Use of the Internet does not equate to using the telephone. In the case

Like hell. Even if parts of the Internet use RF, it still is NOT Ham Radio. The simple fact of the matter is that if we want to use the Internet, there's no reason whatsoever to even use ham radio. The Internet is likely to always be faster, cheaper, and more efficient that ham radio.

>> Thanks for your thoughtful post. It's been enlightening. Perhaps

>valuable info just wear out and stop posting, and I don't blame them.

With all due respect, that's nonsense. I've been on packet since 1988, and I never saw any of this until I came here to the Internet and made enough of a stink that I finally dragged out some information. The "other side" has been quite vocal on ham packet. Where are the rebuttals or explanations from your side? When I was first on packet, there were a lot of informative bulletins about what was going on on the "cutting edge" of packet, and explanations of how the existing system works. But you're right; all the techie types have moved on to more esoteric things, leaving the functional system to fend for itself, and offering no support for the existing system or ideas on how to move to the next level. It's the exact pattern I've discussed here earlier.

I stand by what I said earlier. Packet Radio is dying, and will soon be dead, for all practical purposes. Read my earlier posts for the reasoning.

Would this chip be legal under the STA via TAPR? It has a power input
signal output, so it may be feasible to add the APC, if needed to
operate beyond 1 watt. I currently doing alot of reading, trying to get
a good feel for SS. I understand the jist, but not alot of the really
low-down terminology.

Later,

Not so bad when only a few locals go at it though. Thats what I am looking at right now. I can taste a fast internet connection via radio right now, cause I want to put the thing together, and get something like that working. If everyone else gets interested, I'd happily give up my plans to the amateur community.

Carl, do you know of a less expensive chip (not many external parts), that will take care of the job? The chip I mentioned is really functional. Simplicity in some areas (like putting something like this together) is worth the cost, and if I engineer something, I try to go for ease of use, since its me who usually winds up doing R&D.

Of course, this idea will only materialize if apply and getting a STA from TAPR would allow me to use this chip . . .

Thanks,

I have a BIG problem here with my (nice) Kantronics KPC3 TNC.

Every time when I try to upload a file to my local BBS I get a
yapp error with the message "cancel was received from the sender"
I get the error after uploading +/- 8kb.

I'm 100% sure that it's NOT the program what I'm using (Winpack)
as it's working fine on my other TNC.

It's really driving me crazy, and I hope that someone somewhere
can help me !

Please email me back on 101326.2010@compuserve.com as Compuserve's
news server is not a very good one.

Thanks in advance and 73's

Noel

The most recent version of T4 can ONLY be found at sartg.intron.se
(Scandinavian Amateur Radio Teletype Group ftp-archive)
The most recent version is 1.5alpha24 and you need version 1.4 as well.
Both versions are available at the above site. The FUNET archive hasn't been
updated for years!

Stig, SM5IO, maintains the SARTG archive with new versions via E-mail
from Finland.

Have a look around, most amateur radio related software is available!

Hello,

I'm lookin' for some noise reduction algorithm and an introduction
in that subject.
Does anyone have some literature about it?

It would be nice to hear from you.
You can drop me a mail (see below).

Thanx in advance,
Uli

Thanks for confirming my initial thoughts on the LAN and WAN speed relationship, Gary.

As far as jumping the user's access speeds is concerned, I am not sure how easily, if at all, that will be possible. As you point out below, 1200 bps for users is very well established, for good or bad, and it may be difficult to push them to higher speeds without improved services to support it.

>56 kb is now an off the shelf option for users, and the Slovenian systems

Just as a proverbial thought exercise, what would you see as the impact on a WAN of a successful SS implimentation on the LAN level?

>Your biggest problem is dealing with legacy 1200 baud users. If you can't

>gateway device for the 1200 baud user simply by attaching another port.
>(Note a Linux based switch would be preferred, but the JNOS boxes are
>legacy items here and still serve adequately.)

I agree 100%... I would see each LAN "hub" as needing both a 1200 bps and (at least one) higher speed port (56K or what-ever). In this area, most users are on 2m 1200 bps. In fact, I know of only 2-3 that even have 70cm abilities. This would dictate a 2m 1200 bps port plus the high speed user port as a minimum for each switch.

My feelings at this time are to use Linux boxes for the switches. That just seems to offer the potential for easier changes in the future. I imagine that a few DOS JNOS advocates may disagree, but that is my view on the subject.

From what I have been able to gather from the Slovenian project, they initially started with 1200 bps user ports but have been able to slowly phase them out as time has passed. With the cheap, easy 56K radio modems, it seems that most users have been making the change.

But, as I said above, there will have to some motivation for users to make the move to higher speeds.

I don't see the "traditional" packet services as providing this motivation...

The store and forward BBS may have a place, but it will likely play a reduced role, perhaps more like an Internet Usenet server.

DX Clusters might be a valid service, but that sort of depends on the political winds, but that is another story perhaps better suited for r.r.a.policy.

HTTP servers I believe will prove to be a passing fad... Packet is not the Internet and the Internet is not Packet. Perhaps some form of HTTP may survive, but I suspect that the full implimentation will be found only on Internet gateways and that on the Internet side.

APRS I am not sure about... It does serve a purpose, but it seems to attract a fairly limited subset of Packet users. In other words, APRS seems to lack a mass appeal.

Convers servers may be the draw to pull the users to higher speeds... I guess that convers servers offer about the closest thing to "chasing DX" that packet can offer, but this sort of shoots holes in the idea of keeping the LAN traffic withing the LAN as much as possible unless the long distance traffic gets dumped onto an Internet gateway.

Perhaps we need a totally new draw for the users to move to higher speeds. Any ideas?

Error correction? Huh? I've implemented Pactor 1 twice and I never found
anything "error correcting" about it. It even has the same weak CRC
(error check code) as packet.

If you're talking about Pactor 2, this is a mode not worth supporting
because it is proprietary, its creators don't want you to know what
signals you are transmitting...

I agree with you however that Pactor is better suited for HF than packet,
mainly because it uses short "packets" with low header overhead, and since
it doesn't try "carrier sensed multiple access" like packet nomally does which
won't work on HF

I got mine form the authors of the program!! I think the Baycom group
has got their own homepage - have you tried there?? I don't know the
address! One of the problems with the modem, is that the chip ??3105 is
out of production, and is very hard to get! You can use a Am7910/11, but
I don't have any drawings. I think the best solution is to get an old
1200 baud telephone modem and modify it! I have modified different types
with grate luck. Both 2 wires and 4 wires are usable. The 4 wire is the
easiest to modify, only some ptt parts and a special made cable between
pc and modem. One problem is the two tones, the standard modem uses 1300
- 2100Hz, and packet radio is 1200 - 2400Hz (or vica versa ???). But it
makes no problem on the air!!

Hugo...

Try the December 1995 QST on page 36. I have built it and it works
great. To find the TCM3105 modem chip call JDR Micro at
1800-538-5000 and the Printed Circuit Boards can be had at Far
Cuircits at 1-847-836-9148. Most everyting else on the board can be
found at Digikey, 1800-344-4539.

Good Luck and enjoy the cheapest way to get into 1200 baud packet.

Hello Mark.. I had a PK-88 that caused the same thing to happen, and it was reduced a LOT by running the TNC and radio from different, isolated power sources. That's easy at home with a wall-cube for the TNC, but when portable it's harder. Does it get better if the KPC-3 is running on it's internal 9v battery?

Just some things to check out.. Good luck!

But HF Packet isn't NEW, it's been tried and used and proven to be a
spectrum hog and slow!! The X.25 protocol was never designed for
an HF radio link.
Try PacTOR instead, it's got error CORRECTION and not just error
CHECKING that Packet has. PacTOR was designed specifically for HF
radio paths. Makes all the difference in the world, and there are
plenty of stations using it. No need to beg folks to use PacTOR!!

>how stupid) would be useful.

Ok, a harmonic of the crystal reference oscillator in the TNC falling near
145.01 MHz is a common problem not limited to just Kantronics TNCs.
This can be aggravated by using a HT with rubber ducky because the
antenna winds up very near the source of the interference. Use of an
external antenna (fed with good coax) can help. But the real problem is
a lack of adequate real shielding of the TNC. With MFJ TNCs, this can
be easily solved by scraping the paint off the mating surfaces of the
case and adding a few more screws (good VHF shielding practice
requires a screw at least every 5 cm along a seam). The KPC-3 is
harder to effectively shield.

There is another approach to this problem. And that is to move the
harmonic away from the operating frequency. You can do that by
installing a "gimmick" capacitor across the reference crystal in the
TNC and warping it off your operating frequency. You can make a
gimmick capacitor from a couple of short lengths of insulated wire
(enamel insulation is best). Just solder a wire to either side of the
crystal, then twist the wires together until you get enough capacitance
to shift the frequency so that its harmonic moves off of your operating
frequency. The microprocessor crystal's frequency is non-critical to
the operation of the TNC, so this won't hurt anything, and it gets the
pesky harmonic out of your way.

No, Carl, what is required is cubic money, lots of sites in out of the way places, and the dedicated hams to travel to them at unholy hours to keep them operational. The amateur network is by nature sparse. That's because there aren't that many digital hams, and because they aren't distributed uniformly across the areas the network must serve. In an emergency, many of the unattended sites may go down, and the few hams who keep them going may have more pressing concerns than driving out to the distant site and restoring it to operation.

Now HF can help to span some of the distances required to be traversed by a WAN, but restrictive rules limit how much we can do at HF. So we need lots of unattended VHF+ relay sites. That's expensive, and requires more manhours than we have to keep functional. That's the fundamental problem facing amateur WANs.

>> How in the hell is your RF WAN going to operate in a disaster? Does it have
>> Solar panels? Wind generators? Honda generators? The Survey Says! NO.
>> Most WAN nodes are like the LAN hams shack. Void of any emergency power.

>hypothesis, but rather a damning condemnation of the average ham's
>preparedness, understanding of what's needed for disaster communications,
>and lack of technical ability to design and field a reliable system ...

Money, money, money. Hardened sites with emergency backup are *expensive*. And we need *lots* of them, many in out of the way places, to establish viable WANs. Few of the GRAPES sites are hardened, not because we aren't competent, but because we can't *afford* to harden them all. Even if *every* amateur became active in the digital modes, that wouldn't change much. Our distribution is still extremely sparse in many areas where we *must* have trunk connectivity in order to have a viable WAN.

The best we can hope to do is to be able to get signals out of the immediate disaster area and then interconnect them to the remaining wired network for further transport. Only the wired network providers have the cubic money to maintain large scale WANs. That's why TAPR's direction is the correct one. We need to concentrate on our LANs

and MANs and leave the WAN job to the major wired networks who have the resources to establish and maintain them.

I notice that Thomas Sailer replied to your previous post as well.
He is correct about the new docs about the quality of the new docs
on this. In addition, he has modestly neglected to point out that
he is the one responsible for developing the sound card driver and
the improved documentation.

Good Work! Now if it were only possible to implement a single
unified driver that would support both packet and conventional
sound card applications so it wasn't necessary to reboot in between.
That would be heaven.

I struggled with their documentation for a long time wondering
if it was really going to give me a packet terminal through
my sound card. This is confusing because Flexnet is first and
foremost a networking system. Then I spent quite a bit of time
with it and discovered that it does indeed do what you want.

I wrote a step by step article on how to get it up and running
on soundcard packet under DOS and Win95. This article may help
you figure out if it will really do what you want or not.

You can pull the article (in microsoft word format) off tapr's
ftp site at:

ftp://ftp.tapr.org/pub/wa0ptv

I think this will help you through the set up and let you sort out whether this is really the answer for you or not. Currently there is no other alternative for sound card packet that I know of. The reason for this seems to be that there are timing deficiencies in the usual sound card drivers that require that specialized drivers must be used to decode packet.

Walt's right. HF packet (as presently done) is an abomination. Of course we shouldn't have to continue doing packet the same (brain dead) way, but there are a number of obstacles to changing to better methods, not the least of which are overly restrictive regulations for HF digital operation.

Currently, our best option is to use Clover II to establish point to point virtual circuits between disjoint parts of the VHF+ packet networks. Clover's quasi-duplex nature makes it easy to run TCP/IP on top of it. If the rules would let us use Clover 2000, we could get much better thruput, but even at the 750 bps Clover II offers, we can do *much* better than using Bell 103 and AX25 on HF. Clover's FEC and adaptive power control make its links much more robust than AX25 HF packet.

Of course, given the right rules, we could do much better than Clover on HF. But that's only a fantasy as long as we have the NIMBY attitudes of current HF occupants dominating the amateur political scene and dictating the sorts of rules we must operate under.

>(error check code) as packet.
>

Tom, PacTOR-1 (one) does have error CORRECTION.. It's nothing like
Packet.. Go to the Paccomm web site and there is a page-long technical
explanation of Memory ARQ and how it works. The difference between PacTOR
and Packet can't possibly be shorter packet lengths, most people that DO
use HF Packet know to shorten the PACLEN parameter. Read about Memory ARQ..

http://www.paccomm.com/pactor.html

When I use BMKMULTY software with a RTTY T.U. on PacTOR (no TNC), it has a
counter in the corner that counts how many blocks have been reconstructed out
of busted blocks of data. It saves the broken data, compares it to the
repeated block, and if errors are rebuildable it puts the block together. It's
more complicated than that, but that's how it 'looks' like it works.
Some of the TNC makers didn't implement the PacTOR protocol correctly, and it
works pretty crappy on them.. But that's not the fault of SCS or the protocol.

>If you're talking about Pactor 2, this is a mode not worth supporting
>because it is proprietary, its creators don't want you to know what
>signals you are transmitting...

Well, I would like to try Clover or PacTOR-2, but they want an arm and a leg
for the controllers, both of them.. Supposedly Clover is better for long, fast
binary data transmissions, and PacTOR-2 is optimized for short QSO-type text
data.. Too bad they both are hiding their codes, etc.. I'll stick to using
BMKMULTY software for PacTOR for now (with a HAL ST-8000 T.U.), it copies signals
that are not audible to me, and barely visible on my X-Y scope.. If your TNC
can't do that, it isn't implementing the PacTOR protocol right..

order
> to have a viable WAN.

So the LANs in the areas served need to pony up for the WAN trunks ... sounds
like an "association" to be formed ... with some membership assessments ...

> The best we can hope to do is to be able to get signals out of the immediate
disaster
> area and then interconnect them to the remaining wired network for further
transport.
> Only the wired network providers have the cubic money to maintain large scale
WANs.
> That's why TAPR's direction is the correct one. We need to concentrate on our
LANs

> and MANs and leave the WAN job to the major wired networks who have the resources
> to establish and maintain them.

With some rules changes that I'm pretty sure you'd support, HF could do some gap
spanning ... albeit at slower rates than the microwave bands, but at least it would be
more survivable ... if we depend *too much* on the internet and other wired carriers,
we will fall on our faces when the shit hits the fan and we really need to shine ...

I am *not* saying "it's a piece of cake" or "it's free" ... like most things that are
worthwhile, it will take some investment of both time and money ... but I still

believe that it's doable ...

Yes I know that packet has been tried and I also know about pactor. BUT again I ask where do you find either one being use on HF. Yes I know that you can use packet on satellites, but most of us ham doesn't have the money, space, or knowledge working packet that way. I would like to see some use of it for us everyday hams. Especially with the talk of the declining interest in ham radio. We need to bring some life back into it.

While I'm on the subject of packet or pactor. Why can't we use the modem in our computers to work packet. I would think that most modems would have no problems running at 9600 bps, 1200 bps, or what ever speed you might need. Can anyone explain why we are not use these modems.

The only thing is, this is what got me into HAM radio. That is, to setup a web server over the radio from my own home. You can't do that with telephone and if everyone wanted to serve web pages from their own machines under such a system, your communications bureaus would be flooded with applications. BBSs are for, all rights purposes, dead or dying. With the advent of Internet, even the telephone access ones will begin to dissappear, unless they have at least internet mail and newsgroups. The BBS is quickly becoming the POP3 or IMAP server, and SMTP mailer. BBS will never allow the random access a pseudo or real multitasking OS with a TCPIP stack allows. Humans are by nature parallel processors. Constraining them to one stream of information is like turture. You have had to have heard your buddies listening to other bands,etc in the background, when talking with them over chat radio. I usually have several compositions and several messages in reading under Netscape Communicator. BBS do not allow this interoperability. Even though I mention web pages as a primary reason for me getting into packet, I would have to rate chat with friends/reliable email/great email readers as my top three tying reasons for using TCPIP and a remote access mail system. A BBS would never allow this without the development of some hardcore protocols, and why? TCP IP is already here and waiting, along with a ready made OS-Linux capable of running it all for free (if that is your point of debate), as well as some very nice applications.

Just my take,

David L Pearce

I have found just about any hamfest that has somebody selling CDROMs has a couple of choices. I recently bought the "InfoMagic LINUX Developer's Resource" for $12. It contains RedHat 4.0, Slackware 3.1, and Debian 1.2 kernals. Plus X-Windows, and an enormous amount of software and on-line documentation (6 CDs). Installation was simple by making a boot disk from a dos machine. (I prefer the RedHat as it needs only a single boot/install diskette). I now have a cool X-Windows interface, AX.25 on packet radio, Web Server, FTP server, Telnet server, and much much more. Hard to beat that price for all the neat stuff!

Source record: 29614

You can find a lot of Pactor usage from 7.060 - 7.080, and also from 14.060 - 14.080. On weekends there are plenty of signals present. Usage seems less during the week, and also in the evening. There are several powerful Pactor automated mailboxes on 80m, from 3.620 - 3.640, which can be monitored.

If you have a modern, solid state SSB transceiver, you can become operational on Pactor for $139 (the current cost of a new MFJ-1276). There may be cheaper approaches, but that is the most inexpensive Pactor-capable TNC that I'm aware of.

I find Pactor to be a very enjoyable mode, with a very low entry cost (compared to, say, satellite operations). On most days, Pactor links run at 200 baud. That's low by computer standards but fine in a 1-on-1 ragchew situation. The displayed copy is always error-free and QSOs tend to last 30-60 minutes, which gives you plenty of time to get into some good conversation beyond just your rig and antenna. Pactor is also robust in the face of nearby QRM, QSB, etc. My TNC often gives correct copy on signals that I WOULDN'T care to strain to copy on CW or SSB.

I encourage you to try Pactor... it's sure been fun for me!

73,

Rich, WB2MBM

<sigh ...> I've made the suggestion over and over to the folks at TAPR.

The "appropriate" place to post this is NETWRK @ WW. No it is not a
"news
group" nor is it an "email address." It is however somewhere that will
make the information available to the "other 99%" of hams who are
working
on ham RADIO networks. If you don't like NETWRK @ WW you could use TAPR
@ WW,
or any other designator of your choice.

Curious, how do you get those TCP/IP frames to the internet if not by
the use of some commercial network (i.e. "telephone") ? U.S. West has
some new packet radio links on the ham bands? Tell us about those
"redundant connections". What ham band do they use? Sure sounds neat
that Seattle has an ISP that uses ham radio for all of it's
connectivity!

What is the name of this ISP? Perhaps we can establish an RF link to
it from down here in the Portland area. That would be whizzy!

Steve, let us all know how this stuff in Seattle works. Sounds very
exciting
that you have found a way to access the internet without using
commercial
wire networks (i.e. "the telephone"). Please post contact information
for
the ISP you use so that others who are interested in ham radio
networking
can contact them (and obtain accounts into their RF network on the ham
bands.)

Are there other ISPs doing this? Enlighten us please ...

2984. About tcp-group, and TAPR's BBSSIG...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-04 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.com>

Source record: 29619

The following concerns the "tcp-group" Internet discussion group formerly operated by Brian Kantor, (The "owner" of the amateur TCP/IP "network") and
the "BBSSIG" Internet discussion list operated by TAPR.

I have recently been attributed with "shutting down" the tcp-group list, though it is not clear how I was supposed to have done that. I certainly disagreed with many of the attitudes I found there, but mere disagreement can only stimulate a vital, ongoing discussion. Only stagnant, aimless discussions and ideas break up easily when exposed to simple disagreement.

This is why Hank W0RLI and myself are Censored from the TAPR BBSSIG list. The clique of "Internet Forwarding" advocates who have taken that list over and chased off the real Ham Radio BBS SYSOPs are terrified of any form of disagreement.
Hank and I pointed out that as Packet Radio BBS SYSOPs we should of course be using Radios, and these "hams" found that concept to be intolerable.

Hank wanted to know if "advancing the use of the telephone" was included in (Tucson Amateur Packet Radio) TAPR's charter...
Greg Jones WD5IVD (President of TAPR) didn't like the tone of THAT question, and immediately after, both Hank and I were Censored from the TAPR
BBSSIG list.
For my part, I hadn't made ANY postings to the TAPR BBSSIG for several days at that point. I was Censored along with Hank, simply because it was known that I disagree with Greg Jones in his insistence that as hams, we would all
be better off using the Telephone with TCP/IP, than we would with Radios and
anything *other* than TCP/IP.

There is a rumour now which says Greg is crawfishing on this issue with a will, trying to place blame of TAPR's censorship on some mysterious "group"..
Let's see..
Greg Jones is not only president of TAPR, but a member of TAPR's Board of Directors as well.. Which "group" is it, I wonder, which has more authority within TAPR than Greg Jones? No, there's no doubt as to "who" is currently running (and ruining) Tucson Amateur Packet Radio.

Hank's question about TAPR's charter IS interesting, isn't it? If TAPR's charter is to advance Amateur Packet Radio, how does Greg Jones justify tying up TAPR's resources and reputation with his personal quest for "Radioless Ham Radio", and 'Amateur Telephone", ect., in order to prop up amateur TCP/IP?

Amateur TCP/IP has proven to be unable to even experiment with, much less emulate the sort of long-haul amateur radio links which are vital to our global ham radio digital network today. For this reason, amateur TCP/IP is literally no good for amateur packet radio networking of any significant scale. It is a failure as an amateur radio application, partly because the high volume, high speed "connectivity" it requires cannot currently be provided with radio links.

This is why there is no global amateur TCP/IP digital radio network at all, and it also the reason that amateur TCP/IP fanatics are alone in the amateur
radio community in promoting and seeking to legitimize "Radioless Ham Radio",
where they depend on telephone links to provide long-haul communications, *pretending* that this is ham radio by referring to the telephone link as "advanced amateur radio networking", "Internet Forwarding", ect... It's a sick attempt to prop up amateur TCP/IP while damaging mainstream packet radio,
and directly contrary to the best interests of the amateur radio community.

Greg knows his ideas and actions cannot stand up to close examination, and would be laughed down in a free, open debate. He is terrified now of seeing these matters openly, publicly discussed, and with good reason. He knows he is in the wrong.
Hence the frightened, cowardly Censorship to be found at TAPR, in defense of
actions which are detrimental to the amateur radio digital community. (Internet Forwarding)

Now, take a look at these last few postings to tcp-group and judge for yourself as to why the tcp-group list REALLY shut down.

------------------------- First Quote: ------------------------------

OK. I KISS-ize my TNC (if possible), buy a cheap old computer, obtain a copy of one of the seemingly infinite variations of NOS, get an IP address, and after a few wasted evenings call up a friend and get her to come over and help me install it. Then what can I do?

Telnet to a BBS.

Great. Really great.

There are at least two problems here: it's too hard and the rewards are too few.

Installing and configuring IP could be made much simpler. Wired networks are now using address negotiation (via PPP), BOOTP, DHCP, etc. to make configuration automatic. We're still assigning static addresses. There's little flexibility and no support for mobility. It's a pain for the person assigning them and it's a pain for the person using them. If the software were "plug and play" more people would at least give it a try.

The second problem is that IP offers little advantage over AX.25 or other packet protocols. Sure, one can telnet and ftp at the same time (which would, of course, when done on a 1200 b/s link be sure proof of insanity) but is that really what users want? The really growing parts of packet radio are APRS, DX Cluster and Converse nodes. Do these exist for IP? Where are even better applications?

A third problem is that things don't work. Radio-based IP breaks some crucial assumptions that are fundamental to the protocol stack design. We haven't fixed those yet. An end-to-end connection is often difficult and in some cases impossible to obtain. In almost any comparison the BBS forwarding network puts the IP network to shame -- it may be slow, inflexible and technically not very sophisticated but at least the BBS network delivers messages!

Sorry to be so negative, but I see major problems. If IP is to succeed on the radio it needs to be easy to install and configure, offer at least the same applications as available via other means and preferably more, and work as well or better as other protocols and networks.

Jeff, k9ja

---------- And Finally.. ----------

I suggest this list has served its function. In the last two years it has had zero substance, and before that was dedicated to converting NOS to a BBS.

I think it's time to pull the plug.

Steve Sampson (No callsign given)

I didn't shut that list down. It shut itself down, and rightly so.

Thanks for taking time to look and think this over. I figure since Greg Jones is "big enough" to attempt to stifle other people's differing opinions, I'll be "big enough" to tell my side of the story whether Greg Jones likes it or not.

I don't "goose-step" in line with ANY cowardly censor. If Greg Jones thinks censorship is so wonderful, I'm sure there are places he can go where it is considered to be normal, acceptable behaviour... Or have all of those little communist dictatorships dried up by now?

No matter. I'm sure that if Greg looks long enough and low enough, he'll find a place where his behaviour is considered to be perfectly acceptable, and the general population there will accept Greg's idea of arguing an issue (undercut and censor those with opposing views) as the way mature, responsible and decent adults deal with opposing viewpoints.

In my last posting to BBSSIG, I suggested that the list is made for Amateur Radio BBS SYSOPs, not "Internet Forwarders" who's actions are destroying that very same BBS forwarding network we are allegedly here to discuss and

promote. I invited them to take a hike.
Today I am suggesting that if Greg Jones wants to take a position of protecting those who are actively working to destroy the amateur packet radio BBS network, that he is quite welcome to "take a hike" as well. Those actions denigrate TAPR, and Greg's office within TAPR.
Hams will never feel the same about the president of TAPR again, now that Greg Jones has used his office to protect and promote the "Internet Forwarders" who are currently vandalising the BBS network.

Greg has perverted this forum into becoming something directly contrary to it's stated purpose. He has turned this list into a refuge for the very people who are currently destroying the amateur packet radio BBS forwarding net. He protects them at every turn.

Why?

That's a good question! I'll ask the question Hank Oredson asked, once again...

Where in TAPR's charter does it call for us to "advance and develop" the art of using the telephone? Isn't TAPR suposed to be an Amateur Radio organization?

If not, TAPR, then please change your name, charter, and logo to reflect that.

If so, TAPR, then please change your "policy" and your "leadership" to once again reflect your charter.

The membership were told they were supporting Amateur Packet Radio when they paid their TAPR dues. - Not "Amateur Telephone". They most certainly were not told their money would go to promoting the vadalization and destruction of the Packet Radio BBS forwarding network, and to protecting those who participate in that vandalism.

Greg Jones is digging a deep hole for himself, coming out of the closet as a "LandLine Lid", and Censoring anyone who tries to speak up for Amateur Radio. The other folks at TAPR need to think about whether they are ready to jump down in that hole along with him.

: and repair rather than have to spend out on a replacement unit.

Hi Phil,

I work in the PC maintenance industry and most of the time, manuals for monitors are as rare as rocking horse s**t. I am afraid that it is unlikely that you will get a service manual for any specific monitor. You could try Mauritron. We repair them by guesswork, skill and knowledge of generic monitor design.

What are the symptoms, I might be able to give you some pointers...

Geoff.

In article <33df136a.45827773@news.cyberhighway.net> Glen Quarnstrom, glenq@NOSPAMcyberhighway.net writes:
>No, that's what the TAPR folks were saying, and I find that appalling.
>BBSs and their users are part and parcel of packet, and I don't see
>that changing any time soon, even if some of you are trying your best
>to kill them off.
>

That is not what was said.

What was said was that many of us no longer actively participate in the BBS mode of operations. I did it back in 1984 for years. Like anything within our hobby, I have moved on to other interests in the digital community.

Everyone else on the TAPR board feels that BBS operations has just as much a right on the bands as any other mode of amateur operations. If TAPR had no interest in BBSs why would be support a SIG, publish a book on setting up a BBS, and support other packet radio activities that support BBS operations.

I expect BBS systems to be a key player in much of the new LAN/MAN technology that is being developed. Who else is already in a position to provide coverage (cells) to local hams to get connected to someplace else. The issue is making the BBS into a network and not users of the network as they are in many cases currently. The issue is not just store and forward the issue is changing the definition of how networking happens.

Cheers - Greg

2987. Dear Charles N5PVL

From TAPR BBS SIG (6/4/97)

Dear Charles.

You are under a misconception that the BBS SIG Chair, the TAPR Internet Mgmt Committee, and myself placed you on the .ignored list because of your views. Sorry, but you are incorrect. What got you removed from this list was the manner in which you made those comments. I could go back and dig through the records (they are all on-line), but after two years and many of your messages it came down to insults, four letter words comments, and other abrasive approaches that got you removed from this list. Everyone has a right to speak out, but after a long history of messages that were clearly outside the statement of this group of acceptable behavior you were the first to ever have been placed in the .ignored file.

The BBS SIG Charter as setup by Dave Wolf, WO5H, states:
The criteria for appropriate publication are simple: messages should 1) advance the discussion at hand, 2) not perpetuate one of our many Holy Wars (i.e., my OS is bigger than your OS, or "your protocol stinks because"), and 3) avoid personal attacks (FLAMES).

This is the primary reason you were removed from the list Charles. Even after many messages that asked for change over the past several years.

>I have recently been attributed with "shutting down" the tcp-group list,
>though it is not clear how I was supposed to have done that. I certainly
>disagreed with many of the attitudes I found there, but mere disagreement
>can only stimulate a vital, ongoing discussion. Only stagnant, aimless
>discussions and ideas break up easily when exposed to simple disagreement.

Charles, when I saw you posting over there...I thought why ? Why would you impose yourself into a group that you knew was not doing what you liked. Amateur radio is about having fun and enjoyment. The folks over on TCP-GROUP were doing what they liked to do in the hobby. You didn't see them over here on the BBS SIG (although I am sure we have people in both lists) or on some other lists talking about TCP related stuff and jamming their beliefs on others without really any interest in the operation of the group. You went over there to cause problems, pure and simple. You were looking for another place to be able to post to and see a reaction and use as grist in your mill. Is that all you have to do Charles ?

Charles, why are you not out helping Joe Borovetz, Bob Morgan, and others maintain or improve the TexNet Network in your area ? Why spend your time writing inflammatory messages on the Internet and Packet radio ?

Feel free to use the node I built in Denton in 1987 and feel free to use the node installed in Sherman that was built by Tom McDermott and feel free to use the other RF networking happening in Texas that others built; however, you make a big deal about RF networking, but can you modify a radio ? Have you ever built a TexNet node or other node stack, have you ever built a RF network over several sites and maintained them ? Have you ever operated faster then a 1200 baud TNC out of the box ? Have you done anything more then operate a BBS all these years and complained about what others were doing that you couldn't ? The world is full of people dissatisfied with their lives, but that is no reason to take it out on others trying to enjoy what they like to do and help the community as a whole to promote it.

I don't mind folks being outspoken, but there are Netiquette Guidelines for the Internet. There are guidelines for this list. I would hope you would take the time and read them someday. Finally the group decided to enforce them, instead of just shutting down the list.

>This is why Hank W0RLI and myself are Censored from the TAPR BBSSIG list.

>be using Radios, and these "hams" found that concept to be intolerable.

You and Hank were not removed from the BBS SIG because of your stand against Internet Forwarding or the use of landline facilities. The reason that you were both removed because of the manner in which both you and Hank would state your case. As someone suggested, the alternative was to just shutdown the list. Barry didn't want this to happen so he requested that the current position be supported by the TAPR Internet Mgmt Committee. It did. This was after some two+ years of messages to base it on.

>Hank wanted to know if "advancing the use of the telephone" was included in
>(Tucson Amateur Packet Radio) TAPR's charter...
>Greg Jones WD5IVD (President of TAPR) didn't like the tone of THAT

>Radios and anything *other* than TCP/IP.

This is pure nonsensus Charles. You have a right to state your position, but you don't have a right to dominate and close down lists because you feel a certain way. These SIGs are about communications and information sharing, not about places to stand up and continue to shoot people down for what they are doing. Amateur radio is about inclusion not exclusion.

Charles, how could you ever read into anything I ever wrote that said we should abandon radio communications ? Everything I have been doing over the last five years is focused on RF issues for going faster. The work on the SS STA, the current rule making, the project management of two spread spectrum radio projects, and all the other things I am involved in. You really should read my last TAPR President's corner. I am sorry that this offends some deep set belief, but in order to get people doing more then just 1200 baud we have to step forward, but at the same time step back. Our most talented people are spending countless hours trying to maintain the RF networks you feel are so important to life on earth, but this means that many of them don't have time to work on new things. We need to let them work on these new things. Some people that could help are so turned off by your attitude and posting and other flamers they do their own thing at home and are very happy and never share their abilities outside their own local area.

What you are going to see and are seeing is a re-emphasis on LAN/MAN issues. Not the abandonment of radios ? The question is -- how do you connect these new LAN/MAN when they are first built. You sure are not going to use 1200 or 9600 baud networks. You have to use something to allow networking to happen until there is enough critical mass to see the growth of RF networking where it makes sense. If you believe that people are going to build new networks to replace ROSE, TexNet, and others with the current user support levels -- I think you are wrong. We must again grow the local infrastructure so that regional and local groups have the ability to do things. TPRS (Texas Packet Radio Society) like many regional groups has no cash flow to do anything major in the way of investment in new technology or networks, because the members have left for other things. 1200 or 9600 baud networking to access the BBS, Weather servers, or chat with a friend, doesn't cut it for the members who left these regional groups over the last 5 years.

How is your approach going to stop the erosion of regional groups networking and the reduction in membership, because things are not changing.

>There is a rumour now which says Greg is crawfishing on this issue with a
>will, trying to place blame of TAPR's censorship on some mysterious "group"..
>Let's see..
>Greg Jones is not only president of TAPR, but a member of TAPR's Board of
>Directors as well.. Which "group" is it, I wonder, which has more authority
>within TAPR than Greg Jones? No, there's no doubt as to "who" is currently
>running (and ruining) Tucson Amateur Packet Radio.

Not at all. We have had a group for this since the first problems between you, Brian Lantz, and some others happened. At that time, the exec committee felt TAPR needed to establish a committee to deal with these issues. We did. That committee was requested several times to place you on the .ignored list and finally after about the 4th request over two years it agreed.

As to who runs TAPR. TAPR is directed by a board of directors. You can visit http://www.tapr.org/tapr/html/info.html and see who the board of

directors are. The TAPR Board meets on-line through the year and has two meetings a year in person at Dayton and the TAPR annual meeting. The board sets goals and direction and the exec committee then makes these happen. The exec committee is made up of Pres, VP, Sec, Trea, and others that are required to make the day to day happenings of TAPR possible. As President, like many groups, I run the day to day operations. However, TAPR is a very consensus based organization -- volunteer organization don't work otherwise.

I have as much power in the organization as the Board of Directors allows me to have...no less, no more.

>Hank's question about TAPR's charter IS interesting, isn't it? If TAPR's
>charter is to advance Amateur Packet Radio, how does Greg Jones justify
>tying up TAPR's resources and reputation with his personal quest for
>"Radioless Ham Radio", and 'Amateur Telephone", ect., in order to prop up
>amateur TCP/IP?

I would request that you actually point to a project like this that TAPR is doing currently ? I don't think you will find one -- will you ?

Charles, I spend to much of my personal time doing this. To a large extent it is a lot of fun being President of TAPR -- I sure don't get compensated for it and I sure put in a lot of my own money in at times, but I get to work closely with people like Phil Karn, Dewayne Hendricks, Lyle Johnson, Tom McDermott, Tom Clark, and many, many others. These folks are doers. When they get a thought in their head they want to make it happen. TAPR is all about enabling people who want to do things. However, people like yourself make it very hard to justify the volunteer time I place in TAPR. Although I am sure that will pass in the next few hours after I post this reply. I'll get it out of my system until the next bunch of messages accusing me of something else evil I have done. After a while the squelch level just goes up enough to handle it.

This all comes with the job. If I have to take heat on projects or concepts so other doers can get it done without being accused of treason, then so be it. I will feel very good about myself when I leave TAPR for what it has accomplished and what path I help set for the organization in the next 10 years.

TAPR is a vital organization with over 2500 members. You can either be a part of the group and get active and have a voice by doing things, or you can sit on the sidelines criticizing and complaining about how people don't listen to you and you are ignored and how bad things are in general. The amateur radio rule is that those who do (code and build) decide what others are doing in the future. You have to be a part of a positive project focus, not a tearing down of others to get things done and accomplished. This is what TAPR is all about inclusion of people in the hobby, not exclusion. TAPR is stronger because he have HF, TCP/IP, RF, DSP, GPS, APRS, etc etc and other interests actively being pursued within the organization.

>is in the wrong.

Wrong again Charles. I am sure I posted on here several months ago that I would be glad to debate you on this in a public forum at Dayton HamVention, HamCom in Arlington or else where. I go about 20 hours a day with work, so it is impossible to debate you in the electronic forum. I would just get shouted down like so many others that try to write back to you on issues likes this. Talk to Dave Wolf, there might be an hour opening at HamCom in three days -- I would be glad to have some defined debate happen at that time on this issue. It would be much fun.

Charles, if I knew I was wrong, I would admit it. TAPR would probably be off doing something else. I believe that amateur packet radio has to move back to the experimental days and begin to build a new RF LAN/MAN structures for packet radio operations. How is that different from what you want ? I believe that in this approach we can generate a new level of interest and thus have a chance to be in a position to take advantage of new OTH technology that is coming from the military that delivers fractional T1 on the HF bands. However, without a new LAN/MAN concepts then we can't generate the needed support for your long haul networks. I do disagree with you that what you see now as networking is what we will use in the future as long-haul networks.

Long haul networks to be successful and maintainable over a long period of time have to be short in the number of nodes that they cross. Again, this is the Tom McDermott paper I keep referring to printed several years ago. Did you ever read it ? Going from here (Texas) to Calf over 50 nodes never worked very well and the chance of a node failure was very high over time. If and when we can take advantage of new OTH technology or SS on HF or get packages on the SkyStation systems, or use AMSAT satellites or launch our own gateways, or any of a number of similar systems, then the implementation of long-haul networks using existing

technology as implemented in the amateur packet radio community doesn't make a lot of sense.

I don't see you out doing Charles....just advocating that others should. Led by example, not by shouts of anger and rage!

>Hence the frightened, cowardly Censorship to be found at TAPR, in defense
>of actions which are detrimental to the amateur radio digital community.
>(Internet Forwarding)

Nope. See above. If you could conform to the tenets of this group and you could convince Barry that you could and he asked the committee to reinstate you -- I am sure you could be back on the list as an active member Charles.

>Now, take a look at these last few postings to tcp-group and judge for
>yourself as to why the tcp-group list REALLY shut down.

Oh -- one sided for sure the selection of your material Charles. I will not bore the group with the various posts you made that were screams of rage, insults, and general tripe on the TCP-GROUP. Just like the messages you use to post on the BBS and NET SIG lists. As I said above, you went over there to look for trouble. Thus, a rather large group of amateur radio operators who like to play ham radio and combine that love with TCP/IP operations got subjected to your messages. Life is to short for this approach Charles. I am sure many left -- like they did on the BBS SIG when you would start a rant thread on the SIG.

If you want change Charles, you have to changes things locally and regionally ? Can you ? Will you ? It is easy to write, it is a lot harder to devote time to learning and the creation of systems others can use.

>
>------------------------ First Quote: ------------------------------
>
>
>
>---
>
>I didn't shut that list down. It shut itself down, and rightly so.

This does prove my statement above. You went over there to intentionally cause problems. You had a group of amateur operators having fun -- you showed up and the only defense they had, other then placing you in the .ignored file, was to turn the list off. This list chose the first in order to allow others to continue to communicate. TCP-GROUP chose the later, because they then don't have to put up with statements about censorship.

Anyway, the tenets of the list have been posted for a long time and the list managers just got tired of them being trampled over all these years. Welcome to the Internet.

>Thanks for taking time to look and think this over. I figure since Greg
>Jones is "big enough" to attempt to stifle other people's differing
>opinions, I'll be "big enough" to tell my side of the story whether Greg
>Jones likes it or not.

So glad you did Charles.

>I don't "goose-step" in line with ANY cowardly censor. If Greg Jones thinks
>censorship is so wonderful, I'm sure there are places he can go where it is
>considered to be normal, acceptable behaviour... Or have all of those
>little communist dictatorships dried up by now?

I don't think censorship is wonderful; however, protecting the rights of
others to communicate about things without the fear of being insluted,
yelled out, or abused -- especially to new comers to the BBS operations
-- is very important to me. If you could have followed the guidelines
set forth when you joined the list, I am sure you would still be allowed
to comment on various things stated on the BBS SIG.

The issue is not about censorship, the issue is about the manner and
method in which you approached the use of the communications channel you
were allowed to use -- namely the BBS SIG e-mail list.

>No matter. I'm sure that if Greg looks long enough and low enough, he'll
>find a place where his behaviour is considered to be perfectly acceptable,
>and the general population there will accept Greg's idea of arguing an
>issue (undercut and censor those with opposing views) as the way mature,
>responsible and decent adults deal with opposing viewpoints.

Name calling will get you far in the world Charles. At least I don't see
any four letter words in this message -- good use of the dictionary.

>In an earlier posting, I suggested that this list is made for Amateur Radio
>BBS SYSOPs, not "Internet Forwarders" who's actions are destroying that
>very same BBS forwarding network we are allegedly here to discuss and
>promote. I invited them to take a hike.

Charles, the mission statement of the BBS SIG list is:
The BBSSIG mailing list charter is to provide a forum for the exchange of
information about packet radio bulletin board systems and the issues
surrounding their operation. News, hints & kinks, case studies, and such
are welcome parts that we hope will become an important resource for those
participating in the forum.

If someone wants to broaden their knowledge about how to do Internet
stuff, that is their right within the hobby to learn new things. If they
asked this question on the list, you would start a holy war on the
subject. This again is what got you removed from the list. Not playing
well with others is the simplest analogy. Someone asking about Internet
related forwarding has just as much right as someone asking about HF
forwarding on the BBS SIG.

>Today I am suggesting that if Greg Jones wants to take a position of
>protecting those who are actively working to destroy the amateur packet

>radio BBS network, that he is quite welcome to "take a hike" as well. Those
>actions denigrate TAPR, and Greg's office within TAPR.
>Hams will never feel the same about the president of TAPR again, now that
>Greg Jones has used his office to protect and promote the "Internet
>Forwarders" who are currently vandalising the BBS network.

Who would these people be Charles ? Why is it always 'those people'. I never hear abour a project or projects. It is always me, those, and them ?

Examples ?

>Greg has perverted this forum into becoming something directly contrary to
>it's stated purpose. He has turned this list into a refuge for the very
>people who are currently destroying the amateur packet radio BBS forwarding
>net. He protects them at every turn.

Is it me ? or is it you Charles ? I stated the mission statement of the group above. Where you breaking it or was TAPR breaking it by allowing you free rein to trample on people when you wanted to. The purpose if any of the TAPR lists is to facilitate communications, not to perpetuate holy wars on one subject. The USENET is the place to hold these types of discussions -- and I am sure some would debate that USENET shouldn't be the place either. :-)

>Why?
>
>That's a good question! I'll ask the question Hank Oredson asked, once
>again...
>
>Where in TAPR's charter does it call for us to "advance and develop" the
>art of using the telephone? Isn't TAPR suposed to be an Amateur Radio
>organization?

TAPR charter states:
The purpose for which the corporation is formed is that set forth in its Articles of Incorporation as from time to time amended; namely, for scientific and educational
purposes. In the pursuit of that purpose the corporation will perform scientific testing and research into development and improvement of technological systems for use in the amateur radio service, including, but not limited to, digital packet radio communications; research and testing of systems, hardware and software, for packet radio local area networks and computer network systems; and disseminating to the public information obtained as a result of such research and testing. The corporation is not formed for a pecuniary gain, and no part of the assets, income, or profit of the corporation is distributable to, or will inure to the benefit of its directors or officers except to the extent permitted under the Not-for-Profit Corporation Laws of the State of Arizona.

There is the charter. Now, the question again is -- where can you point to a project that TAPR is doing that is 'telephone based' or uses telephones ? All projects currently being done are amateur radio focused.

Let's look at a few TAPR projects over the last 18 months.

1. We got published Tom McDermott's, N5EG, very good educational publication on designing wireless systems -- modems, error correction, and lots of other information required to design and build digital **radio** communications systems.

2. Mic-Encoder. Attaches to your **radio** and allows you to do APRS without all the extra equipment.

3. TAC-2. Totally Accurate Clock. Give 1-5ns timing accuracy using GPS **radio** technology. Allows the amateur radio community to have access to technology that costs $10K and up for less then $300. Add to that the upcoming TOC -- and we can deliver a very precision 10Mhz OSC for **radio** applications that require a high accuracy timing element. There are some very interesting outcome from this project that can happen.

4. METCON-2. Second generation remote telemetry and control (using **radios** and AX.25) for remote control and gathering weather and other data at sites and making it available over a network or else where.

5. Spread Spectrum Issues. TAPR got issued a STA by the FCC for research into Spread Spectrum communications (**radios** again -- hum interesting trend here ah ?). There have only been two such STA's issued before the TAPR one and the TAPR one has the most people participating then either of the two before. TAPR has over 40 people involved with at least 4 or 5 different **radio** projects happening there covering 6meters, 2meters, 900Mhz, and 2.4G. At the last TAPR board meeting in Dayton the board funded one of these projects as a TAPR project for alpha units. Not just radios, but very fast radios that can find spectrum to operate over.

6. NADSD (North American Digital Systems Directory). TAPR took over the digital listing in the repeater directory that the ARRL was droping. In less then two months we had a fully automated systems that allows groups to submit *radio* network nodes. Add to that the ability to map out all these nodes so you can see where things are in a region. Next year we should be able to implement a method to show linking between these *radio* based networks and allow people to see paths.

I could list at a lot more of what TAPR is doing, but I think these make my point.

Charles, how is it that TAPR is doing 'telephone' projects again ? I must have missed that someplace ?

How is advancing the amateur radio art a bad thing ?
How is enabling amateur digital communicators the ability to experiment a bad thing ?
How is having fun in the hobby a bad thing ?

What exactly is your issue ? Is it just that you dislike me ? Is it as simple as a personality conflict ? or is it really something about what TAPR is doing ?

>If not, TAPR, then please change your name, charter, and logo to reflect
>that.
>
>If so, TAPR, then please change your "policy" and your "leadership" to
>once again reflect your charter.

See the charter above. I don't know what you thought TAPR was about, but from your contuined posting on the subject, you have a very short understanding about what TAPR is doing. TAPR is about enabling people to do things -- education, research and development, kits, writing, etc. It is not about exclusion or name calling.

>The membership were told they were supporting Amateur Packet Radio when
>they paid their TAPR dues. - Not "Amateur Telephone". They most certainly
>were not told their money would go to promoting the vadalization and
>destruction of the Packet Radio BBS forwarding network, and to protecting
>those who participate in that vandalism.

>Greg Jones is digging a deep hole for himself, coming out of the closet as
>a "LandLine Lid", and Censoring anyone who tries to speak up for Amateur
>Radio. The other folks at TAPR need to think about whether they are ready
>to jump down in that hole along with him...

If I have to burned at the stake for excepting other amateur radio operators of different view points, beliefs, and operating practices, then so be it. I don't believe it is a bad thing NOT to tell someone to leave or go away when they are doing something different. You obviously from your many postings do believe this Charles.

If someone shows up at TAPR with a willingness to learn, experiment, or support others doing these things -- then Welcome to TAPR!

It will be a cold day in hell when I tell someone they are not wanted for just having an interests in doing something different. Everyone is encouraged to join and become a particpant in working and getting things done. Not setting around talking about them.

Cheers - Greg Jones, WD5IVD
President TAPR
(and proud of it!)

>PktMon12 can be found at http://garbo.uwasa.fi/pc/ham.html

There is a program called RITTY 2.0 by Brian Beezley, K6STI. It uses a
Sound Blaster and your computer to implement an all-DSP modem for RTTY and
Pactor. Works with most sound cards for RTTY, but needs a genuine
brand-name Sound Blaster 16 for Pactor.

I use it, and it's fantastic--better copy than many other things I've
tried. Its copy is noticeably better than a HAL P38 under some
conditions, and the P38 is the best thing I've tried until I got RITTY.

It costs $150. A demo version can be downloaded from:
http://www.megalink.net/~n1rct/rit2/rit_dl.html

I have no commercial connection with Mr. Beezley--just a *very* satisfied
customer.

73,
Peter - KD7MW

Help!
I just picked up a used PacCom 220 and a IBm PS 2 Computer at a
hamfest. The computer is running Windows 3.1. I need help with cable
setup and operation. Any suggestions and help would be appreciated.
Thank you.

2990. Re: Problems with RF from KPC-3 Plus on 145.010

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-04 00:00:00 UTC
From: Jim Wagner <wagnerj@proaxis.com>
Message-ID: <33964FD2.2203@proaxis.com>
Source record: 29625

Greetings -

The old TAPR TNC-2 design (ie, MFJ-1270, etc) had a major flaw with the processor crystal having a nearly perfect harmonic at 145.01.

Many "solved" this problem by tweaking down the processor oscillator frequency (there is a trimmer cap) so that the harmonic was just a little lower. The change in baud rate which this produced is miniscule but it does slow the internal time/date clock.

I thought that this had been corrected in the KPC-3 (which I have, but never use on 145.01). The solution given above should work in your case also.

I've used pactor with the PK-232, KAM, MFJ, PTC-I, and PTC-II. I've also
used packet on HF. Pactor is 1000 per cent better! All these units have

error correction if you are connected in ARQ. The PTC-I and II include analog memory ARQ. The others use a digital method which is not quite as good under weak signals but it still works.

The PTC-II is expensive because it uses some high power DSP chips. The HAL P-38 (board) is under $300 now, I believe (not bad).

The pactor II protocol is proprietary (as is pactor I) but it's available for license from SCS. The problem at the moment, I believe, is that no one but SCS makes a DSP modem powerful to run pactor II. Paccomm purchases the main PC board from SCS and adds their own front panel board and case.

My opinion - lets leave packet on VHF/UHF where it belongs and use the modes designed for HF (pactor and clover) on HF.

2992. Narrow filter choices for Pactor, RTTY?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-06-04 00:00:00 UTC
From: "F. Feeney" <*spamsaver*_fkf1@cornell.edu>
Message-ID: <5n44fo$lpq@newsstand.cit.cornell.edu>
Source record: 29627

Hi,

I picked up a new 706MKII and want to use it on the digital modes as well as voice. I see they have quite a choice of filters, 250hz, 350hz, 500hz and some voice bandwidth filters. I wasn't aware of all of the choices, so I grabbed the 500 hz unit. I'm wondering if I should trade it for the 350 as that is the one they list for RTTY. I expect to operate both RTTY and Pactor, and at 200 baud I think the narrower filter would be too tight. Does anyone have experience with the narrow filters in these modes who can confirm or correct my feeling that I'll need the 500 hz filter to run pactor? Thanks

kevin, WB2EMS

Out here in these sparsely populated areas, we used to have better packet throughput than the populated areas, for a number of reasons; primarily fewer feuding hams to gum up the works. Most of the work was done on a shoestring, by hams who weren't particularly technically competent but just jumped in and learned as they went along. A bit of enthusiasm can make up for a lack of money or expertise. We've had solar powered packet sites in the past, and a small group of us that came from CB and had almost no technical ability when we started put up the first solar powered repeater in the area, and one of the first anywhere. That machine is still there, running on solar power. Other systems have battery backup good for several days.

>That said, if you can manage to come up with the necessary funding, I
>could promise you that at least in NH, we could build a nice HS WAN.

Get out and scrounge your own funding, or do it on the cheap. We did it, so can you.

Nothing's stopping you from doing that right now. Of course, for you
to do that, both you and the recipient have to be on-line at the same
time. What if the recipient is doing other things with his computer,
or has it turned off, etc?

>Many other applications come to mind, but it sounds sort of like you
>have the view that a BBS is the answer to everything ... I don't share
>that view and I hope you don't really either ...

BBSs are not all that much different from the current methods used on
UseNet. Stuff is forwarded from one system to another, albeit a bit
more efficiently than the ham system does it.

Had thought about it, but that would need a tower anywhere you put a node, that was high enough to clear everything in the path between. Could get expensive, but might be a good idea for a cross country leap. It would also take some uncanny aiming skills, and a good controller so that the laser could be kept aimed even during severe tower vibrations, and this is even with a huge array of detectors on top of each tower for receiving.

I think that the Slovenian system uses custon TNCs w/68000 processors.
If you are interested in how its done, this is the hardway, nowadays.
Now there are 68000 based microcontrollers (683xx series) that have ram
memory controllers, address decoding, and chip selects built in the
chip, and is directly intended for the embedded market.

Your response was reasonable, however, it is indicative of one who is more used to one stream/one thought type interaction with a computer. I could never go back to that. BBSs only allow that.

> no additional utility.
>
Perhaps conceptually, but in reality, POP and SMTP allow you to edit alot of messages at once, because graphical browsers only based on tcpip support them in a parallel fashion. I do not believe that it is overly complicated for the average ham to connect to a radio TCPIP network. If so many millions of people use the internet everyday from dialup PPP systems, it will not be a problem for the same HAM to connect to a TCPIP node over radio, given a certain amount of plug and play equipment/software (and I am currently working on a solution to the problem, that will work in a point and click manner).

> When you want to outline the advantages of TCP/IP, you should mention
> some
> new things made possible by it, not the same old hat that the BBSes
> are already providing.

POP protocol allows one to access email with a normal browser, that is a bit more interactive than a

MORE?----------

line and one message at a time. And even worse, is that you have to directly interact with the BBS over a slower link to write your message, which makes involved editing all but impossible except to the really patient. Why do this when I have the possibility of a multiwindow editor with complex functions already available? And still more, as I said, http serving from my own home is still interesting to me, and BBSs will never allow this. Right now I have to depend on my Commercial telephone, Commercial phone modem, and Commercial internet provider. I am working towards making this available over the radio in my area. I'm not waiting for BBS's single stream method of information conveyance and unrealiable mail transport methods to kill packet. When my project is completed in about a year, I will tell all those folks who want to listen to me on the subject anything they want about my project, once I know that it is working properly and that the idea is feasible. Until then I can only hope that there are enough hot coals left in the fire to keep packet alive, because as long as the BBS model is continued, there will not be any new flames of enthusiasm found in packet.

Correct. There is likely to be an entry level demand for 1200 baud services
for quite a while yet. And some applications only need such low rates, APRS
for example, to be highly useful. The point I want to stress is that there isn't
much of a niche for 9600 baud. It is too little for more intensive modern
applications support, and it is too difficult for entry level use. By the time
you buy a data radio to do it properly, you're close to the cost of much higher
performance options.

>>56 kb is now an off the shelf option for users, and the Slovenian systems

>
>Just as a proverbial thought exercise, what would you see as the
>impact on a WAN of a successful SS implimentation on the LAN level?

Probably very little different from any other higher speed LAN level systems. Activity on the WAN depends very much on the mix of applications being used, and on how much of that is intra-LAN and how much of it needs to be inter-LAN. Only the latter impacts the WAN. SS doesn't change that in any particular way.

>>Your biggest problem is dealing with legacy 1200 baud users. If you can't

>I agree 100%... I would see each LAN "hub" as needing both a 1200 bps
>and (at least one) higher speed port (56K or what-ever). In this area,
>most users are on 2m 1200 bps. In fact, I know of only 2-3 that even
>have 70cm abilities. This would dictate a 2m 1200 bps port plus the
>high speed user port as a minimum for each switch.

Yes. It is useful to co-locate the switch with the duplex repeaters for LAN users. This is easily done by tapping off the bit regenerator for the duplex repeater. You can have the gateway located elsewhere in the LAN, but you'll pay a performance penalty if you do since it will be at least one extra hop away from the user and/or the trunk.

>My feelings at this time are to use Linux boxes for the switches. That
>just seems to offer the potential for easier changes in the future. I
>imagine that a few DOS JNOS advocates may disagree, but that is my
>view on the subject.

Yeah, to handle higher speeds, you need a switch computer with enough capability that it can host Linux anyway, so this makes sense. We've stayed with JNOS boxes to date simply because we started our switched network before Linux was available, and there is inertia to change because the current switches work well enough, and we have other uses for our limited manpower.

>From what I have been able to gather from the Slovenian project, they
>initially started with 1200 bps user ports but have been able to
>slowly phase them out as time has passed. With the cheap, easy 56K
>radio modems, it seems that most users have been making the change.

Their situation is a bit different than ours. Everyone there seems to have to build in order to do packet. For us, many users simply burn the plastic to gain capability to do packet. Their 56 kb implementation is also a bandwidth hog compared to our 56 kb systems. That's a problem for our bandplans and would force the LAN frequency to the 33cm band or higher. That's not necessarily bad, but much of the test equipment amateurs use to maintain sites only goes to 500 MHz (surplus stuff), so moving above 70 cm can be a bit trying on the budget of those charged with maintenance of the systems. Antennas and cavities are also another issue, with stuff suitable for 70 cm more common

and less expensive than for the higher bands at present. That's likely to change in the near future.

>But, as I said above, there will have to some motivation for users to
>make the move to higher speeds.
>
>I don't see the "traditional" packet services as providing this
>motivation...

Correct. We need to move on to more network aware applications.

>The store and forward BBS may have a place, but it will likely play a
>reduced role, perhaps more like an Internet Usenet server.

As a first cut, replacing BBSs with POP servers would be useful. And NNTP can be used for bulletin distribution. This has the advantage of allowing a more seamless interface between the two network's services, and also allows use of the now common, powerful, and convienent internet tools on the amateur network as well. But even more useful perhaps would be to use broadcast bulletion servers to avoid repetitive access to the same bulletins by each user of the LAN. In this regard, our topologies may be better suited to a different paradigm than the internet uses. This could be an area for active development of novel architectures.

>DX Clusters might be a valid service, but that sort of depends on the
>political winds, but that is another story perhaps better suited for
>r.r.a.policy.

Yeah, I know what you mean. Cluster users seem determined to build their own parallel networks.

>HTTP servers I believe will prove to be a passing fad... Packet is not
>the Internet and the Internet is not Packet. Perhaps some form of HTTP
>may survive, but I suspect that the full implimentation will be found
>only on Internet gateways and that on the Internet side.

I tend to disagree. I think browsers, web pages, and the like will become common on amateur packet if we increase the basic performance of the underlying network so that it can support their use properly. At 56 kb and above, browsing the amateur network is little different from browsing the internet with a good connection. And being able to seamlessly integrate text, images, and sound bites makes the amateur network much more rich and useful.

>APRS I am not sure about... It does serve a purpose, but it seems to
>attract a fairly limited subset of Packet users. In other words, APRS
>seems to lack a mass appeal.

APRS is more powerful and attractive than you may think. Usage has become very high in this area among transmitter hunters and others who need to coordinate their actions over a broad area. It is well suited to several sorts of public service events. I think this may become the primary remaining usage of 1200 baud. Lots of network bandwidth isn't

needed for APRS to be useful, and it is easy to integrate it with the voice radio of the mobile user, IE with something like the MIC-E.

>Convers servers may be the draw to pull the users to higher speeds...
>I guess that convers servers offer about the closest thing to "chasing
>DX" that packet can offer, but this sort of shoots holes in the idea
>of keeping the LAN traffic withing the LAN as much as possible unless
>the long distance traffic gets dumped onto an Internet gateway.

I just cannot see the attraction of converse servers. If you are in radio range, you're likely in *voice* radio range, and that's a much better way to converse than keyboarding. It would seem to be useful only in inter-LAN usage where the participants are out of effective voice range. But with all the repeaters here in the US, a large number now linked, that's not all that common.
